Event history analysis with Stata

Event history analysis (EHA), also known as survival analysis or time-to-event analysis, is a statistical approach used to examine the timing of events and the factors that influence their occurrence. When utilizing Stata, a powerful statistical software package, researchers can perform sophisticated event history analyses to explore phenomena such as unemployment durations, disease progression, product failures, and more. This article provides a comprehensive guide to conducting event history analysis in Stata, covering essential concepts, data preparation, model estimation, interpretation, and advanced techniques to enhance your research.

Understanding Event History Analysis

What Is Event History Analysis?

Event history analysis focuses on modeling the time until an event occurs. The key features include:

- Duration or survival time: The length of time from a defined starting point until the event.
- Censoring: Situations where the event has not occurred for some subjects during the observation window.
- Hazard function: The instantaneous risk of the event at a given time, conditional on survival up to that point.

Common Applications of Event History Analysis

EHA is widely applied across various disciplines, including:

- Epidemiology (e.g., time to disease remission)
- Sociology (e.g., career transitions)
- Economics (e.g., unemployment spells)
- Engineering (e.g., time to equipment failure)
- Political science (e.g., onset of conflicts)

Preparing Data for Event History Analysis in Stata

Data Structure Requirements

Stata requires data in a specific format for event history analysis:

- Start and stop times: Indicating the duration of the risk period.
- Event indicator: A binary variable denoting whether the event occurred (1) or was censored (0).
- Covariates: Variables that may influence the hazard rate.

Example Data Format

```
| id | start_time | end_time | event | covariate1 | covariate2 |  
  
|----|-----|-----|-----|-----|-----|  
  
| 1 | 0 | 5 | 1 | ... | ... |  
  
| 2 | 0 | 3 | 0 | ... | ... |  
  
| 3 | 2 | 8 | 1 | ... | ... |
```

Data Preparation Steps

- Transform your data into a "long" format with start and end times.
- Create censoring variables where necessary.
- Ensure correct coding of event indicators.

Stata's `stset` command is essential for declaring survival data.

```
```stata  

stset end_time, failure(event) id(id) origin(start_time)

```
```

This command prepares the data for analysis, specifying the duration, failure (event), and identifiers.

Conducting Basic Event History Analysis in Stata

Declaring Survival Data with `stset`

Before modeling, define your data:

```
```stata
```

```
stset end_time, failure(event)
```

```
```
```

Optionally, specify entry times and at-risk periods if applicable.

Estimating Survival Functions

The Kaplan-Meier estimator provides non-parametric survival estimates:

```
```stata
```

```
sts graph
```

```
```
```

or

```
```stata
```

```
sts list
```

```
```
```

Performing Cox Proportional Hazards Model

The Cox model is a semi-parametric approach to evaluate covariate effects:

```
```stata
```

```
stcox covariate1 covariate2
```

```
```
```

Interpret the hazard ratios (HRs), which indicate the relative risk associated with covariates.

Advanced Techniques in Event History Analysis with Stata

Parametric Survival Models

Parametric models specify the distribution of survival times, such as exponential, Weibull, or log-normal:

```
```stata

streg covariate1 covariate2, distribution(weibull)

```
```

Advantages include easier extrapolation and understanding of the baseline hazard.

Handling Time-Varying Covariates

Stata supports covariates that change over time:

```
```stata

stcox tv_covariate1, tv(covariate1)

```
```

Ensure your data is structured with multiple records per individual to reflect changes over time.

Stratified Models

To account for unobserved heterogeneity, stratify by a variable:

```
```stata

stcox covariate1, strata(stratum_variable)

```
```

Checking Model Assumptions

Proportional hazards assumption can be tested using Schoenfeld residuals:

```
```stata

estat phtest
```

```

Interpreting Results from Event History Models

Hazard Ratios

- $HR > 1$: Increased hazard (risk) associated with the covariate.
- HR

Confidence Intervals and Significance

Assess statistical significance via p-values and confidence intervals:

```
```stata
```

```
// Output includes hazard ratios with 95% C.I.
```

```

Model Fit and Diagnostics

Use residuals and goodness-of-fit tests to evaluate model adequacy.

Event history analysis with Stata is a powerful statistical approach used to examine the timing and occurrence of events within a specified time frame. As researchers and analysts increasingly focus on understanding the dynamics of events such as employment transitions, health incidents, or failure times in engineering, Stata's capabilities for conducting event history analysis (EHA) have become a valuable asset. This comprehensive review explores the features, methodologies, and practical applications of event history analysis within the Stata environment, offering insights into its strengths and limitations.

Introduction to Event History Analysis

Event history analysis, also known as survival analysis or duration analysis, focuses on modeling the time until an event occurs. Unlike traditional regression models that often analyze static outcomes, EHA emphasizes the timing and the process leading up to an event. Examples include the time until a patient relapses, the duration of unemployment, or the lifespan of mechanical components.

In the context of social sciences, epidemiology, economics, and engineering, EHA provides a nuanced understanding of how various factors influence the likelihood and timing of events. The core data structure involves a set of individual or unit-level observations with information on start

times, event occurrence, and potential covariates.

Stata offers a suite of commands and tools specifically designed for survival and event history analysis, making it accessible for researchers across disciplines. Its capabilities include non-parametric estimations, parametric models, semi-parametric Cox models, and more advanced techniques such as competing risks and multi-state models.

Core Concepts of Event History Analysis in Stata

Before diving into the technical aspects, it is essential to understand some foundational concepts:

- Survival Time: The duration from a defined starting point to the occurrence of an event.
- Censoring: When the event of interest has not occurred by the end of the observation period or the individual leaves the study prematurely.
- Hazard Function: The instantaneous rate at which events occur at a given time, given survival until that time.
- Survival Function: The probability that the event has not occurred by a specific time.
- Time-Dependent Covariates: Variables that change over time and can influence the hazard rate.

Stata's event history toolkit hinges on these concepts, providing precise and flexible modeling options.

Data Preparation and Management

Effective event history analysis begins with proper data structuring. Stata typically requires data in a "long" format, where each observation corresponds to a time interval during which covariates are constant. For example, if studying employment spells, each individual might have multiple rows representing different job periods, with start and end times.

Key steps include:

- Creating start and stop times (``stset`` command)
- Identifying censored observations
- Coding event indicators

Proper data management ensures accurate model estimation and interpretation.

Stata Commands for Event History Analysis

Stata provides a comprehensive set of commands tailored for survival and event history analysis:

2.1 `stset`: Setting the Data

The `stset` command declares the survival-time data, specifying the time variable, event indicator, and censoring status.

Example:

```
```stata
stset duration, failure(event)
```
```

This command prepares the data for subsequent analysis, defining the risk period and event status.

2.2 Non-Parametric Estimation

- Kaplan-Meier Estimator (`sts`): Provides survival probabilities over time.

```
```stata
sts graph, by(groupvar)
```
```

- Nelson-Aalen Estimator: Computes the cumulative hazard.

```
```stata
sts list, cumhaz
```
```

2.3 Parametric Models

Stata supports various parametric models where the survival distribution is specified explicitly, such as exponential, Weibull, Gompertz, and log-normal.

```
```stata
```

```
streg covariates, dist(weibull)
```

```
```
```

Features:

- Useful when the underlying hazard function follows a known distribution.
- Allows estimation of survival functions and hazard rates.

2.4 Semi-Parametric Cox Proportional Hazards Model

The most widely used model in EHA, the Cox model, assesses the effect of covariates without specifying the baseline hazard.

```
```stata
```

```
stcox covariates
```

```
```
```

Features:

- Handles time-dependent covariates.
- Provides hazard ratios (HRs) for covariates.

Pros:

- Flexibility in modeling complex hazard structures.
- No need to specify the baseline hazard.

Cons:

- Assumes proportional hazards over time.

Advanced Techniques in Stata for Event History Analysis

Beyond basic models, Stata supports several advanced methods:

2.1 Multi-State and Recurrent Event Models

- Multi-State Models: Capture transitions between multiple states (e.g., healthy, ill, recovered).
- Recurrent Events: Model multiple occurrences of the same event within subjects.

Stata commands like ``msset`` and ``ms`` facilitate these analyses, allowing researchers to study complex event sequences.

2.2 Competing Risks

When multiple types of events can occur, competing risks models are essential. In Stata, the ``stcrreg`` command estimates subdistribution hazard models, accounting for competing events.

```
```stata
```

```
stcrreg covariates, compete(eventtype)
```

```
```
```

2.3 Frailty and Random Effects Models

To account for unobserved heterogeneity, frailty models incorporate random effects. Stata's ``stcox`` supports frailty via the ``shared()`` option.

```
```stata
```

```
stcox covariates, shared(clusterid)
```

```
```
```

Interpreting Results and Model Diagnostics

Stata provides comprehensive output for event history models:

- Hazard ratios (HR): Indicate the multiplicative effect of covariates.
- Survival curves: Visualize estimated survival functions.
- Proportional hazards assumption tests: Including Schoenfeld residuals.

Diagnostics include:

- Checking proportional hazards assumption.
- Residual analysis.
- Goodness-of-fit tests.

Proper interpretation of results involves understanding the context and ensuring model assumptions hold.

Practical Applications and Case Studies

Event history analysis in Stata is widely applied across fields:

- Sociology: Modeling employment duration or marriage longevity.
- Epidemiology: Analyzing time to disease onset or recovery.
- Economics: Studying firm exit or startup durations.
- Engineering: Failure time analysis of machinery.

For example, a study on employment spells might utilize ``stcox`` to assess how education, age, and industry influence job duration, with the survival curves illustrating the probability of remaining employed over time.

Pros and Cons of Using Stata for Event History Analysis

Pros:

- User-Friendly Interface: Command-based syntax with clear documentation.
- Comprehensive Suite of Models: From non-parametric to advanced multi-state models.
- Data Management Tools: Efficient handling of censored and time-dependent data.
- Visualization Capabilities: Easy plotting of survival and hazard functions.
- Extensive Support and Community: Large user base with tutorials, forums, and add-ons.

Cons:

- Steep Learning Curve: Requires understanding of survival analysis concepts.
- Limited Flexibility for Complex Models: Some advanced models may require custom programming.

- Proportional Hazards Assumption: Needs to be tested and validated; violations may complicate interpretation.
- Cost: Stata is commercial software, which might be a barrier compared to open-source alternatives.

In summary, whether conducting simple survival estimates or complex multi-state modeling, event history analysis with Stata provides a comprehensive toolkit that supports rigorous, interpretable, and impactful research.

Question What is event history analysis in Stata and when should I use it? Event history analysis in Stata refers to methods used to analyze the timing and occurrence of events over time, such as survival, duration, or transition data. It is particularly useful when studying time-to-event data, like employee turnover or medical relapse, allowing researchers to model the hazard or risk of an event occurring at different points in time. Which Stata commands are commonly used for event history analysis? Common Stata commands for event history analysis include 'stset' to declare survival data, 'stcox' for Cox proportional hazards models, 'streg' for parametric survival models, and 'stptime' for analyzing survival times. Additionally, 'stsplit' can be used to handle multiple spells or episodes. How do I prepare my data for event history analysis in Stata? Preparing data involves structuring your dataset into start-stop or duration formats, coding event indicators, and declaring the data as survival data using the 'stset' command. Ensure that each row represents a time interval or spell, with variables indicating start time, stop time, event occurrence, and covariates. What are some common challenges in event history analysis with Stata, and how can I address them? Challenges include handling censored data, dealing with time-dependent covariates, and ensuring correct data structure. To address these, use appropriate survival commands, properly code censored observations, and structure your data into multiple episodes if covariates change over time. It's also important to check proportional hazards assumptions when using Cox models. Can I incorporate time-varying covariates in event history models in Stata? Yes, Stata supports time-varying covariates in event history analysis. You can do this by splitting the data into multiple

intervals where covariates are constant using 'stsplit', and then specifying these covariates in your models. This allows the hazard to change as covariate values change over time. Are there any recommended resources or tutorials for learning event history analysis in Stata? Yes, Stata's official documentation and user guides provide comprehensive tutorials on survival and event history analysis. Additionally, books like 'Survival Analysis Using Stata' by Stata Press and online courses from statistical training platforms offer step-by-step guidance for implementing event history models in Stata.
