Sample Oncology MCQ with Detailed Explanation

Question: A 55-year-old woman presents with a painless lump in her breast. Mammography reveals a 2 cm spiculated mass. Biopsy confirms invasive ductal carcinoma. Her tumor is ER-positive, HER2-negative, and has a Ki-67 index of 20%. What is the most appropriate initial systemic therapy?

Options:

- a) Chemotherapy alone
- b) Hormonal therapy alone
- c) Chemotherapy combined with hormonal therapy
- d) Observation

Correct answer: b) Hormonal therapy alone

Explanation:

This patient's tumor is ER-positive and HER2-negative, indicating hormone receptor positivity. With a relatively small tumor size (2 cm) and no mention of nodal involvement, endocrine therapy is typically the first-line systemic treatment in hormone receptor-positive, HER2-negative breast cancers. Chemotherapy may be considered based on tumor grade, proliferation index, and risk assessment, but for a low to intermediate Ki-67 and favorable features, endocrine therapy alone can be sufficient initially. The Ki-67 index of 20% suggests moderate proliferation, which may influence decision-making; however, in many cases, hormone therapy remains the primary systemic approach for ER-positive tumors of this size and grade.

The Role of Continuing Education and Practice in Mastering Oncology MCQs

Mastering MCQs is a continuous process that benefits from systematic study, practice tests, and staying updated with the latest guidelines. Regular self-assessment helps identify weak areas and reinforces core concepts. Resources such as question banks, mock exams, and review courses are invaluable tools.
