Understanding the Basics of Chemical Reactions

What Are Chemical Reactions?

Chemical reactions involve the transformation of reactants into products through breaking and forming chemical bonds. These reactions are governed by the conservation of mass, meaning the number of atoms for each element remains unchanged before and after the reaction.

Key Components of a Chemical Equation

- Reactants: Substances that undergo change.
- Products: Substances formed as a result of the reaction.
- Coefficients: Numbers placed in front of formulas to balance the equation.
- States of Matter: Indicated by symbols such as (s), (l), (g), (aq).

Predicting Products of Chemical Reactions

Predicting the products of a chemical reaction requires understanding the types of reactions and the typical behaviors of different elements and compounds.

Types of Chemical Reactions

- Combination (Synthesis) Reactions: Two or more reactants combine to form a single product.
- Decomposition Reactions: A compound breaks down into simpler substances.
- Single Displacement (Replacement) Reactions: One element replaces another in a compound.

- Double Displacement (Metathesis) Reactions: Exchange of ions between two compounds.

Balancing Word Equations

Once you've predicted the products, the next step is to write and balance the chemical equation. Balancing ensures the law of conservation of mass is satisfied.

What Is a Word Equation?

A word equation describes a chemical reaction using words instead of formulas. For example:

Sodium + Chlorine → Sodium chloride

Converting Word Equations to Formula Equations

- Identify the Reactants and Products: From the words, determine the chemical formulas.
- Write the Unbalanced Formula Equation: Place formulas in the correct order.

Example:

Word: Magnesium + Hydrochloric acid → Magnesium chloride + Hydrogen gas

Steps to Balance Chemical Equations

- Write the unbalanced formula equation.
- Count atoms of each element on both sides.
- Add coefficients to balance each element.
- Ensure the coefficients are in the simplest whole-number ratio.
- Check the balance by recounting atoms.

Example:

Unbalanced: Mg + HCl → MgCl₂ + H₂

- Mg: 1 on both sides (balanced).
- Cl: 1 on reactant side, 2 on product side ? put coefficient 2 in front of HCl:

- H: 2 on both sides ? balanced.

Tips for Balancing Equations

- Balance elements that appear only once per side first.
