Sample Electrical PE Exam Questions and How to Approach Them

Below are examples of typical sample questions you might encounter, along with strategies for solving them.

Sample Question 1: Power System Short Circuit Analysis

Question:

A 13.8 kV system has a bolted fault current of 25 kA at the transformer secondary. What is the fault current at the transformer primary, assuming no impedance in the transformer?

Approach:

- Convert transformer secondary voltage to primary voltage (if necessary).
- Use the transformer turns ratio to scale the fault current.
- Recognize that, with negligible impedance, fault current is proportional to the voltage ratio.

Solution:

Transformer turns ratio: $\left(\frac{13.8 \text{ kV}}{\text{Primary Voltage}} \right)$

Assuming a 13.8 kV system, primary voltage is 13.8 kV.

Fault current at primary = Fault current at secondary $\times$ (Transformer ratio)

Since the fault is at the secondary, and the impedance is negligible, the primary fault current is approximately:

\[

$$I_{\text{primary}} = I_{\text{fault, secondary}} \times \frac{V_{\text{primary}}}{V_{\text{secondary}}} = 25 \, \text{kA} \times 1 = 25 \, \text{kA}$$

\]

Note: In real scenarios, impedance and transformer parameters modify this calculation, but this provides a simplified estimate.

Sample Question 2: Lighting Load Calculation

Question:

A commercial building has a connected lighting load of 15 kW. Using the NEC, what is the minimum lighting load allowance for the service size calculation if the load is for general illumination?

Approach:

- Refer to NEC Table 220.12 or applicable sections.
- Apply the demand factors as per NEC guidelines.

Solution:

For general lighting, the NEC typically allows a demand factor of 100% for the first 3000 VA and 35% for the remainder.

- First 3000 VA: $3000 \, \text{VA} \times 100\% = 3000 \, \text{VA}$
- Remaining load: $12,000 \, \text{VA} \times 35\% = 4200 \, \text{VA}$

Total = $3000 \, \text{VA} + 4200 \, \text{VA} = 7200 \, \text{VA}$ (or 7.2 kVA)

Thus, the minimum lighting load allowance is approximately 7.2 kVA.

A unity feedback control system has a transfer function $G(s) = 10 / (s + 2)$. Find the steady-state error for a step input.

Solution:

- For a type 0 system with unity feedback, steady-state error (e_{ss}) = $1 / (1 + K)$, where $K = \lim_{s \rightarrow 0} G(s)$
- $K = 10 / (0 + 2) = 5$
- $e_{ss} = 1 / (1 + 5) = 1/6 \approx 0.167$

Insight:

Practicing such problems solidifies concepts of system type and error analysis.
