Fundamental Principles of Finance

Time Value of Money (TVM)

The concept of the time value of money is central to finance. It states that a dollar today is worth more than a dollar in the future due to its potential earning capacity. The basic idea is that money can earn interest, so the sooner you receive money, the more valuable it is.

- **Present Value (PV):** The current worth of a future sum of money discounted at a specific rate.
- **Future Value (FV):** The value of a current sum of money projected into the future based on a certain interest rate.
- **Key formulas:** PV and FV calculations are foundational in financial decision-making, investment analysis, and loan amortization.

Risk and Return

Understanding the relationship between risk and return is vital. Generally, higher returns are associated with higher risks.

- **Risk:** The chance that an investment's actual return will differ from the expected return.
- **Return:** The profit or loss from an investment over a period.
- **Risk premium:** The additional return expected for taking on additional risk.

- Future Value: $FV = PV \times (1 + r)^n$

Where r is the interest rate per period, and n is the number of periods.
