Overview of Betelgeuse: The Cosmic Behemoth

Physical Characteristics

Betelgeuse, designated Alpha Orionis, is one of the most luminous and massive stars visible to the naked eye. Its distinctive reddish hue marks it as a red supergiant, a phase in the evolution of massive stars characterized by extensive size and relatively cool surface temperatures.

- Spectral Type: M1-M2 Ia-Iab (supergiant)
- Mass: Approximately 10-20 times that of the Sun
- Radius: Estimated at about 950-1,200 times solar radius (~700 million kilometers)
- Luminosity: Around 100,000 times that of the Sun
- Surface Temperature: Approximately 3,500°C (6,332°F), giving it its characteristic red color
- Distance from Earth: Roughly 640 light-years, though measurements vary slightly

These parameters place Betelgeuse among the largest stars known, with a size that could extend beyond the orbit of Mars if placed at the Sun's center.

Variability and Stellar Behavior

Betelgeuse is classified as a semi-regular variable star, exhibiting brightness variations over time due to pulsations in its outer layers. Its brightness fluctuates between magnitude +0.0 and +1.6, a change noticeable to observers and significant in astrophysical modeling.
