Multiple Choice Question

Q: Which of the following best describes the primary function of an airplane's wing?

- A) To generate thrust
- B) To produce lift
- C) To control direction
- D) To store fuel

Answer: B) To produce lift

Short Answer Question

Q: Explain the role of the tail fin in an aircraft's stability and control.

A: The tail fin, or vertical stabilizer, helps maintain the aircraft's directional stability by preventing unwanted yawing movements. It also provides a surface for the rudder, which the pilot uses to control yaw and steer the aircraft left or right during flight.

Diagram/Illustration Question

Q: Given a sketch of an airfoil, identify the parts responsible for generating lift and describe how their shape contributes to this function.

A: The upper surface of the airfoil is curved (cambered), and the shape causes faster airflow over the top, reducing pressure according to Bernoulli's Principle. The difference in pressure between the top and bottom surfaces generates lift, enabling the aircraft to stay airborne.
