Question What are the main types of bonding covered in Chemistry A2 Unit 6B (Jan 2014)? The main types of bonding include ionic bonding, covalent bonding, and metallic bonding. The unit explores their properties, formation, and differences. How does the concept of electronegativity relate to bond polarity in Unit 6B? Electronegativity determines how electrons are shared or transferred between atoms. A difference in electronegativity creates polar bonds, with the greater electronegativity atom gaining a partial negative charge. What are the key factors affecting the strength of ionic bonds discussed in Jan 2014 syllabus? Factors include the charge on the ions,

the ionic radius, and the lattice energy. Higher charges and smaller radii generally lead to stronger ionic bonds. Explain the concept of lattice energy as covered in this unit. Lattice energy is the energy required to break one mole of an ionic solid into its gaseous ions. It reflects the strength of the ionic bonds within the lattice. How does the concept of covalent bonding differ from ionic bonding in A2 Unit 6B? Covalent bonding involves sharing electron pairs between atoms, usually non-metals, whereas ionic bonding involves the transfer of electrons from metals to non-metals, resulting in charged ions. What is the significance of bond enthalpy in understanding chemical reactions, according to Jan 2014 topics? Bond enthalpy measures the energy required to break a bond. It helps predict the energy change during reactions and the stability of molecules. Describe the concept of intermolecular forces discussed in this unit. Intermolecular forces are attractions between molecules, including London dispersion forces, dipole-dipole interactions, and hydrogen bonding, which influence boiling points and solubility. What are the applications of understanding bonding and structure in real-world contexts as emphasized in this syllabus? Applications include material design, pharmaceuticals, and industrial processes where knowledge of bonding influences properties like strength, reactivity, and conductivity. How does the periodic trend in electronegativity affect molecular polarity in compounds discussed in Jan 2014? Electronegativity increases across a period and decreases down a group. Molecules with large differences in electronegativity are polar, affecting their physical and chemical properties. What experimental methods are introduced in this unit to determine bond types and strengths? Methods include spectroscopy, calorimetry for bond enthalpies, and diffraction techniques to analyze structures and infer types of bonding.
