Sample Final Exam Questions with Answers

To aid your preparation, here are some representative questions along with detailed answers.

Multiple-Choice Questions

Q1: Which of the following best describes the concept of GDP?

- a) The total income earned by a country's residents in a year
- b) The total market value of all final goods and services produced within a country in a specific period
- c) The total value of exports minus imports
- d) The total amount of money in circulation

Answer: b) The total market value of all final goods and services produced within a country in a specific period

Q2: An increase in aggregate demand, all else being equal, will typically lead to:

- a) Higher unemployment and lower inflation
- b) Higher output and higher prices
- c) Lower output and higher unemployment
- d) No change in output or prices

Answer: b) Higher output and higher prices

Short-Answer Questions

Q3: Explain the difference between nominal GDP and real GDP.

Answer: Nominal GDP measures the value of all final goods and services produced within a country using current prices, without adjusting for inflation. Real GDP adjusts for inflation by valuing output at constant prices from a base year, allowing for comparison of economic growth over time.

Q4: What is the natural rate of unemployment, and why is it important?

Answer: The natural rate of unemployment is the rate of unemployment when the economy is at full employment, accounting for frictional and structural unemployment. It is important because it represents the baseline level of unemployment that the economy tends to experience without causing inflationary pressures.

Essay Questions

Q5: Discuss the impact of expansionary fiscal policy on an economy experiencing a recession. Include potential benefits and drawbacks.

Answer: Expansionary fiscal policy involves increasing government spending and/or decreasing taxes to stimulate economic activity. During a recession, such measures can boost aggregate demand, increase output, and reduce unemployment. The benefits include short-term economic revival and improved employment levels. However, drawbacks may include increased budget deficits, higher public debt, and potential inflation if the economy overheats. Additionally, if implemented poorly or too late, the policy might lead to crowding out private investment.

Sample Breakdown of a Typical Problem and Its Solution

To illustrate the depth and clarity of Romer's solutions, consider a common problem: deriving the steady-state level of capital in a Solow growth model with technological progress.

Problem Statement:

Given a production function $Y = A K^{\alpha} L^{1-\alpha}$, where A grows exogenously at rate g_A , find the steady-state capital per worker k^* .

Step-by-Step Solution:

- Define Variables:

- $k = K / L$ (capital per worker)

- $y = Y / L$ (output per worker)

- Express Production per Worker:

[

$$y = A k^{\alpha}$$

]

- Determine the Capital Accumulation Equation:

[

$$\dot{K} = sY - \delta K$$

]

In per-worker terms:

[

$$\dot{k} = s y - (\delta + g_L) k$$

]

where (g_L) is the growth rate of labor (assumed zero here for simplicity).

- Incorporate Technological Progress:

Since (A) grows at rate (g_A) , the effective capital per worker must account for technological change:

[

$$\dot{k} = s A k^{\alpha} - (\delta + g_A) k$$

]

- Steady-State Condition:

At steady state:

\[

$$0 = s A k^{\alpha} - (\delta + g_A) k$$

\]

- Solve for k^* :

\[

$$s A k^{\alpha} = (\delta + g_A) k$$

\]

\[

$$s A k^{\alpha - 1} = \delta + g_A$$

\]

\[

$$k^* = \left(\frac{s A}{\delta + g_A} \right)^{\frac{1}{1-\alpha}}$$

\]

Final Explanation:

This derivation shows how the steady-state capital per worker depends on saving rate s , productivity level A , depreciation δ , and technological growth g_A . The solution emphasizes the importance of technological progress in sustaining growth and capital accumulation.
