Design and Architecture of the Calculator

Functional Requirements

- Users should be able to perform four basic operations: addition, subtraction, multiplication, and division.
- The calculator should display the current input and results clearly.
- It should handle multiple sequential operations.
- The application must prevent crashes due to invalid inputs or division by zero.

Non-Functional Requirements

- User-friendly interface.
- Responsive controls.
- Efficient performance with minimal lag.

System Design Approach

The project follows a simple Model-View-Controller (MVC) architecture:

- Model: Handles data processing and calculations.
- View: Manages the GUI components.
- Controller: Processes user inputs, updates the model, and refreshes the view.

Implementation Details

Creating the GUI

The graphical interface is built using Java Swing components:

- JFrame: The main window container.
- JTextField: Displays user input and results.
- JButtons: Represents calculator buttons (digits, operations, equals, clear).

Sample layout:

- A display field at the top.
- Buttons arranged in a grid layout for digits and operators.

```
```java
```

```
// Example snippet for setting up the GUI
```

```
JFrame frame = new JFrame("Simple Calculator");
```

```
frame.setSize(300, 400);
```

```
frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
```

```
frame.setLayout(new BorderLayout());
```

```
JTextField display = new JTextField();
```

```
display.setEditable(false);
```

```
frame.add(display, BorderLayout.NORTH);
```

```
// Panel for buttons

JPanel buttonPanel = new JPanel();

buttonPanel.setLayout(new GridLayout(4, 4));

// Adding buttons for digits and operations

String[] buttonLabels = {

 "7", "8", "9", "/",

 "4", "5", "6", "",

 "1", "2", "3", "-",

 "0", "C", "=", "+"

};

for (String label : buttonLabels) {

 JButton button = new JButton(label);

 buttonPanel.add(button);

}

frame.add(buttonPanel, BorderLayout.CENTER);

frame.setVisible(true);

...

```

## Event Handling and Logic

- Attach `ChangeListener` to each button.
- For digit buttons, append the digit to the display.
- For operator buttons, store the current number and the operator.
- When "=" is pressed, perform the calculation based on stored values and display the result.

- "C" button clears the display and resets stored values.

Sample event handling:

```
```java

button.addActionListener(new ActionListener() {

public void actionPerformed(ActionEvent e) {

String command = e.getActionCommand();

// Implement logic based on command (digit/operator)

}

});

```
```

## Calculation Logic

- Maintain variables to store operands and operators.
- Convert string inputs to numerical types (double or int).
- Use switch-case or if-else statements for operation execution.
- Handle division by zero with exception handling.

```
```java

double num1 = 0, num2 = 0;

String operator = "";

if (command.equals("+") || command.equals("-") || command.equals("") || command.equals("/")) {

num1 = Double.parseDouble(display.getText());

operator = command;

display.setText("");

}
```

```
} else if (command.equals("=")) {  
  
num2 = Double.parseDouble(display.getText());  
  
double result = 0;  
  
switch (operator) {  
  
case "+":  
  
result = num1 + num2;  
  
break;  
  
case "-":  
  
result = num1 - num2;  
  
break;  
  
case "*":  
  
result = num1 * num2;  
  
break;  
  
case "/":  
  
if (num2 != 0) {  
  
result = num1 / num2;  
  
} else {  
  
display.setText("Error");  
  
return;  
  
}  
  
break;
```

```
}  
  
display.setText(String.valueOf(result));  
  
}  
  
...
```

Testing and Validation

Test Cases

- Basic operations: $2 + 3$, $5 - 2$, 4×3 , $8 / 2$.
- Edge cases:
 - Division by zero.
 - Multiple sequential operations.
 - Invalid inputs or empty input handling.
 - Clear functionality.

Simple calculator project using Java is an excellent starting point for beginners venturing into the world of programming, especially in the realm of graphical user interface (GUI) development. This project not only helps in understanding the fundamental concepts of Java programming but also introduces the students and developers to event-driven programming, user interface design, and basic arithmetic operations. In this comprehensive review, we will explore the various aspects of creating a simple calculator project in Java, including its structure, features, implementation details, advantages, and areas for improvement.

Introduction to the Simple Calculator Project

The simple calculator project in Java is typically designed to perform basic arithmetic operations such as addition, subtraction, multiplication, and division. Its primary purpose is to offer a user-friendly interface that allows users to input numbers and select operations easily. Such projects serve as practical applications for understanding Java Swing or JavaFX libraries used for creating GUIs, and they lay the foundation for more complex calculator or financial application development.

Key Objectives of the Project:

- To familiarize with Java programming basics.
- To understand GUI component creation.
- To implement event handling for user interactions.
- To perform and display arithmetic calculations dynamically.

Components and Structure of the Calculator Project

A typical simple calculator project in Java comprises several core components that work together seamlessly to deliver the desired functionality.

1. User Interface (UI) Design

The UI forms the core of any calculator application. In Java, developers usually employ Swing components such as JFrame, JButton, JTextField, and JLabel to create the interface. The layout is generally grid-based for logical button placement.

Features of UI Design:

- An input display area (JTextField) to show current input and results.
- Numeric buttons (0-9) for number entry.
- Operation buttons (+, -, *, /) for selecting operations.
- Control buttons such as '=' (equals) and 'C' (clear).

Design Considerations:

- Clear and intuitive layout.
- Responsive button sizes.
- Visual feedback when a button is pressed.

2. Event Handling Mechanism

Event handling is critical to process user inputs and trigger corresponding actions. Java utilizes ActionListener interfaces to handle button clicks.

Implementation Highlights:

- Each button has an associated ActionListener.
- When a button is clicked, the event triggers a method that updates the display or performs

calculations.

- The 'C' button resets the input field.
- The '=' button computes and displays the result.

3. Arithmetic Operations Logic

The core logic involves capturing inputs, storing operands, and executing the selected operation.

Operational Workflow:

- User enters the first number.
- User selects an operation.
- User enters the second number.
- When '=' is pressed, the program performs the operation and displays the result.

Implementation Aspects:

- Use variables to store operands and operators.
- Implement methods for each arithmetic operation.
- Handle exceptions, such as division by zero.

Features of the Java Simple Calculator

The basic calculator project offers several features, which can be expanded further to enhance functionality.

Core Features:

- Basic arithmetic calculations (+, -, , /).
- Clear button to reset inputs.
- Sequential calculations.
- Simple and clean GUI interface.

Optional Features for Enhancement:

- Handling multiple operations in a sequence.
- Incorporating percentage calculations.

- Supporting decimal numbers.
- Adding a history feature to display previous calculations.
- Improving UI with colors and better layout.

Implementation Details and Code Structure

A typical Java calculator project follows a structured approach, combining GUI creation with event-driven programming.

1. Setting Up the GUI

Using Java Swing, a JFrame acts as the main container. Inside it, components like JTextField for display and JButtons for digits and operations are added.

```
```java
```

```
JFrame frame = new JFrame("Simple Calculator");
```

```
frame.setSize(300, 400);
```

```
frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
```

```
frame.setLayout(new GridLayout(5, 4));
```

```
```
```

2. Adding Components

Buttons are created and added to the frame:

```
```java
```

```
JButton btn7 = new JButton("7");
```

```
JButton btnAdd = new JButton("+");
```

```
// similarly for other buttons
```

```
```
```

Event listeners are attached:

```
``java

btn7.addActionListener(e -> display.append("7"));

btnAdd.addActionListener(e -> {

firstOperand = Double.parseDouble(display.getText());

operator = "+";

display.setText("");

});

...

```

3. Performing Calculations

When '=' is pressed:

```
``java

double secondOperand = Double.parseDouble(display.getText());

double result = 0;

switch(operator) {

case "+":

result = firstOperand + secondOperand;

break;

case "-":

result = firstOperand - secondOperand;

break;

case "":

```

```
result = firstOperand secondOperand;

break;

case "/":

if (secondOperand != 0) {

result = firstOperand / secondOperand;

} else {

display.setText("Error");

return;

}

break;

}

display.setText(String.valueOf(result));

...

```

This modular code structure makes it easier to debug and extend.
