In this article, we delve into the fascinating world of Hidden Mickeys—what they are,

where to find them, their history, and their significance in the Disney experience.

What Are Hidden Mickeys? An Introduction to the Secret Symbols of Disney

Hidden Mickeys are small, often subtle representations of Mickey Mouse, embedded within the design elements of Disneyland and other Disney parks worldwide. Unlike the iconic Mickey logo prominently displayed on merchandise and signage, Hidden Mickeys are intentionally camouflaged, appearing as arrangements of objects, shapes, or patterns that resemble Mickey's silhouette—typically a circle with two smaller circles representing ears.

Origins and Purpose

The concept of Hidden Mickeys originated in the early 1980s. Disney Imagineers, the creative minds behind the park's design, began embedding these symbols as a playful challenge for guests. The idea was to create a layer of interactive discovery, encouraging visitors to look more closely at their surroundings and fostering a deeper connection with the park's meticulous craftsmanship.

Design and Composition

Most Hidden Mickeys are composed of three circles: one large central circle with two smaller circles on top, forming Mickey's iconic head and ears. These can appear as:

- A pattern of objects arranged to form the shape.
- An accidental shape that resembles Mickey.
- A deliberate placement by Imagineers to reward attentive guests.

The beauty of Hidden Mickeys lies in their dual nature—they can be subtle enough to go unnoticed but recognizable once pointed out.

Back Propagation Using Matlab Code

Back propagation using MATLAB code is a fundamental technique for training artificial neural networks, enabling machines to learn from data by adjusting weights to minimize errors. MATLAB, with its powerful matrix computation capabilities and user-friendly environment, offers an excellent platform for implementing back propagation algorithms. Whether you're a student, researcher, or developer, understanding how to code back propagation in MATLAB can significantly enhance your ability to develop efficient neural network models for various applications such as pattern recognition, image processing, and predictive analytics. In this article, we'll explore the concept of back propagation, detail the MATLAB implementation, and provide sample code snippets to help you get started.

Understanding Back Propagation

What is Back Propagation?

Back propagation (short for "backward propagation of errors") is a supervised learning algorithm used to train multi-layer neural networks. It involves propagating the error from the output layer back through the network to update the weights iteratively, minimizing the difference between predicted outputs and actual targets.

Key Components of Back Propagation

- **Neural Network Architecture:** Consists of input, hidden, and output layers with interconnected neurons.
- **Weights and Biases:** Parameters that are adjusted during training to improve network performance.
- **Activation Functions:** Functions like sigmoid, tanh, or ReLU that introduce non-linearity.

- **Error Function:** Typically mean squared error (MSE), measuring the difference between predicted and actual values.
- **Learning Rate:** Determines the size of weight updates during training.

The Back Propagation Process

- **Forward Pass:** Inputs are fed through the network to generate an output.
- **Error Calculation:** The difference between the network output and the target is computed.
- **Backward Pass (Error Propagation):** Errors are propagated back through the network to compute gradients.
- **Weights Update:** Using the gradients, weights are adjusted to minimize the error.

Implementing Back Propagation in MATLAB

Setting Up the Data

Before implementing the algorithm, you need to prepare your data. For simplicity, let's consider a small dataset for XOR problem:

```
```matlab

% Input data (XOR problem)

inputs = [0 0; 0 1; 1 0; 1 1]';

targets = [0 1 1 0]; % Corresponding targets

```
```

Designing the Neural Network Structure

A simple neural network for XOR typically includes:

- 2 input neurons
- 1 hidden layer with 2 neurons
- 1 output neuron

Define initial weights and biases randomly:

```
```matlab
```

```
% Initialize weights and biases
```

```
% Input to hidden layer
```

```
W_input_hidden = rand(2,2)/2 - 1; % 2x2 matrix
```

```
b_hidden = rand(2,1)/2 - 1; % 2x1 vector
```

```
% Hidden to output layer
```

```
W_hidden_output = rand(1,2)/2 - 1; % 1x2 matrix
```

```
b_output = rand(1,1)/2 - 1; % scalar
```

```
```
```

Activation Function and Its Derivative

For the XOR problem, sigmoid activation is commonly used:

```
```matlab
```

```
% Sigmoid function
```

```
sigmoid = @(x) 1./(1 + exp(-x));
```

```
% Derivative of sigmoid
```

```
sigmoid_derivative = @(x) sigmoid(x).*(1 - sigmoid(x));
```

```
```
```

Training Loop with Back Propagation

Implement the training process over multiple epochs:

```
```matlab
```

```
% Set training parameters
```

```
learning_rate = 0.5;

epochs = 10000;

for i = 1:epochs

 for j = 1:size(inputs,2)

 % Forward pass

 input = inputs(:,j);

 % Hidden layer

 hidden_input = W_input_hidden input + b_hidden;

 hidden_output = sigmoid(hidden_input);

 % Output layer

 final_input = W_hidden_output hidden_output + b_output;

 output = sigmoid(final_input);

 % Calculate error

 target = targets(j);

 error = target - output;

 % Backward pass

 delta_output = error sigmoid_derivative(final_input);

 delta_hidden = (W_hidden_output' delta_output) . sigmoid_derivative(hidden_input);

 % Update weights and biases

 W_hidden_output = W_hidden_output + learning_rate delta_output hidden_output';

 b_output = b_output + learning_rate delta_output;
```

```

W_input_hidden = W_input_hidden + learning_rate delta_hidden input';

b_hidden = b_hidden + learning_rate delta_hidden;

end

end

...

```

## Evaluating the Trained Neural Network

After training, test the network to see how well it performs:

```

```matlab

for j = 1:size(inputs,2)

input = inputs(:,j);

% Forward pass

hidden_input = W_input_hidden input + b_hidden;

hidden_output = sigmoid(hidden_input);

final_input = W_hidden_output hidden_output + b_output;

output = sigmoid(final_input);

fprintf('Input: [%d %d], Predicted Output: %.4f\n', input(1), input(2), output);

end

...

```

Expected outputs should be close to the targets (0 or 1), demonstrating successful learning.

Advanced Tips for Back Propagation in MATLAB

Using MATLAB's Neural Network Toolbox

Matlab provides a robust Neural Network Toolbox which simplifies back propagation training with functions like ``train``, ``patternnet``, etc. Example:

```
```matlab

net = patternnet(2); % 2 neurons in hidden layer

net.trainFcn = 'traingd'; % Gradient descent

net = train(net, inputs, targets);

outputs = net(inputs);

disp(outputs);

```
```

Customizing Learning Parameters

Adjust parameters such as:

- Learning rate (``net.trainParam.lr``)
- Number of epochs (``net.trainParam.epochs``)
- Performance function (``net.performFcn``)

Implementing Different Activation Functions

You can modify the activation functions to ReLU, tanh, or others, and update their derivatives accordingly.

Back Propagation Using MATLAB Code: A Comprehensive Guide

Back propagation remains one of the foundational algorithms for training artificial neural networks (ANNs). Its efficiency and simplicity have made it the go-to method for adjusting weights in multi-layer networks. This detailed review delves into the mechanics of back propagation, illustrating how to implement it effectively using MATLAB—an environment favored by many researchers and practitioners for its mathematical prowess and ease of visualization.

Understanding the Fundamentals of Back Propagation

Before diving into MATLAB code, it's crucial to understand the core concepts underpinning back propagation.

What Is Back Propagation?

Back propagation is a supervised learning algorithm designed to minimize the error in neural networks by iteratively updating weights through gradient descent. It propagates the error backward from the output layer to the input layer, allowing each weight to be adjusted proportionally to its contribution to the output error.

Key Components of Back Propagation

- **Neural Network Architecture:** Consists of input, hidden, and output layers with interconnected neurons.
- **Activation Function:** Non-linear functions like sigmoid, tanh, or ReLU that introduce non-linearity.
- **Error Function:** Usually Mean Squared Error (MSE) that quantifies the difference between predicted and actual outputs.
- **Learning Rate (?):** Determines the size of weight updates.
- **Weight Initialization:** Starting weights, typically small random values to break symmetry.

Mathematical Foundations

The core process involves two phases:

- **Forward Propagation:** Inputs are processed through the network to generate an output.

- Backward Propagation: The error is calculated and propagated backward, updating weights via gradient descent.

The weight update rule for a weight w_{ij} connecting neuron i to neuron j :

$$w_{ij}^{\text{new}} = w_{ij}^{\text{old}} - \alpha \frac{\partial E}{\partial w_{ij}}$$

where E is the error function.

The partial derivative $\frac{\partial E}{\partial w_{ij}}$ is computed using the chain rule, which involves derivatives of the activation functions.

Designing a Neural Network in MATLAB

Creating an effective back propagation algorithm in MATLAB involves several steps:

1. Network Architecture Specification

Define:

- Number of input neurons
- Number of hidden neurons
- Number of output neurons

Example:

```
``matlab
input_dim = 2; % Input features

hidden_dim = 3; % Hidden layer neurons

output_dim = 1; % Output neuron
...

```

2. Initialization of Weights and Biases

Random initialization helps break symmetry:

```
```matlab

% Initialize weights with small random values

W_input_hidden = randn(input_dim, hidden_dim) 0.1;

W_hidden_output = randn(hidden_dim, output_dim) 0.1;

% Initialize biases

b_hidden = zeros(1, hidden_dim);

b_output = zeros(1, output_dim);

```
```

3. Activation Functions

Common choices include sigmoid:

```
```matlab

sigmoid = @(x) 1 ./ (1 + exp(-x));

dsigmoid = @(x) sigmoid(x) . (1 - sigmoid(x));

```
```

Implementing the Back Propagation Algorithm in MATLAB

Here's a step-by-step outline:

1. Forward Pass

Calculate activations for hidden and output layers:

```
```matlab
```

% Inputs

$X = [x_1, x_2]$ ; % Sample input

% Hidden layer

$\text{hidden\_input} = X W_{\text{input\_hidden}} + b_{\text{hidden}}$ ;

$\text{hidden\_output} = \text{sigmoid}(\text{hidden\_input})$ ;

% Output layer

$\text{final\_input} = \text{hidden\_output} W_{\text{hidden\_output}} + b_{\text{output}}$ ;

$\text{output} = \text{sigmoid}(\text{final\_input})$ ;

...

## 2. Error Calculation

For supervised learning with target  $T$ :

```matlab

$\text{error} = T - \text{output}$;

% For mean squared error

$E = 0.5 \text{ error}^2$;

...

3. Backward Pass (Error Propagation)

Compute deltas (errors) for each layer:

```matlab

$\text{delta\_output} = \text{error} \cdot \text{dsigmoid}(\text{final\_input})$ ;

$\text{delta\_hidden} = (\text{delta\_output} W_{\text{hidden\_output}})' \cdot \text{dsigmoid}(\text{hidden\_input})$ ;

...

## 4. Updating the Weights and Biases

Adjust weights using the calculated deltas:

```
```matlab
```

```
learning_rate = 0.1;
```

```
% Update weights
```

```
W_hidden_output = W_hidden_output + (hidden_output' delta_output) learning_rate;
```

```
W_input_hidden = W_input_hidden + (X' delta_hidden) learning_rate;
```

```
% Update biases
```

```
b_output = b_output + delta_output learning_rate;
```

```
b_hidden = b_hidden + delta_hidden learning_rate;
```

```
...
```

Full MATLAB Code for a Single Epoch

Here's a complete example assuming a single input sample:

```
```matlab
```

```
% Initialize parameters
```

```
input_dim = 2;
```

```
hidden_dim = 3;
```

```
output_dim = 1;
```

```
% Random initialization
```

```
W_input_hidden = randn(input_dim, hidden_dim) 0.1;
```

---

```
W_hidden_output = randn(hidden_dim, output_dim) 0.1;

b_hidden = zeros(1, hidden_dim);

b_output = zeros(1, output_dim);

% Sample input and target

X = [0.5, -0.3];

T = 1; % Target output

% Activation functions

sigmoid = @(x) 1 ./ (1 + exp(-x));

dsigmoid = @(x) sigmoid(x) . (1 - sigmoid(x));

% Forward pass

hidden_input = X W_input_hidden + b_hidden;

hidden_output = sigmoid(hidden_input);

final_input = hidden_output W_hidden_output + b_output;

output = sigmoid(final_input);

% Error calculation

error = T - output;

E = 0.5 error^2;

% Backward pass

delta_output = error . dsigmoid(final_input);

delta_hidden = (delta_output W_hidden_output') . dsigmoid(hidden_input);

% Update weights and biases
```

```

learning_rate = 0.1;

W_hidden_output = W_hidden_output + (hidden_output' delta_output) learning_rate;

W_input_hidden = W_input_hidden + (X' delta_hidden) learning_rate;

b_output = b_output + delta_output learning_rate;

b_hidden = b_hidden + delta_hidden learning_rate;

% Display updated weights

disp('Updated W_input_hidden:');

disp(W_input_hidden);

disp('Updated W_hidden_output:');

disp(W_hidden_output);

...

```

## Training the Neural Network: Multiple Epochs and Data

While the example above depicts a single data point, real-world training involves multiple epochs over datasets.

### Implementing a Training Loop

- Loop over all data samples
- For each sample, perform forward and backward passes
- Accumulate error to monitor convergence
- Adjust weights after each sample (stochastic gradient descent) or after all samples (batch gradient descent)

Sample structure:

```
```matlab
```

```
for epoch = 1:max_epochs
```

```
total_error = 0;

for i = 1:num_samples

    % Extract sample and target

    X = data(i, 1:end-1);

    T = data(i, end);

    % Forward pass

    % ... (as above)

    % Compute error

    % ...

    % Backward pass

    % ...

    % Update weights

    % ...

    total_error = total_error + E;

end

% Optional: display error

fprintf('Epoch %d, Error: %.4f\n', epoch, total_error);

if total_error
break;

end

end
```

...

MATLAB's Neural Network Toolbox provides built-in functions such as 'feedforwardnet' and 'train' that simplify back propagation implementation. Additionally, custom scripts utilizing basic MATLAB functions like 'sigmoid', 'tanh', and matrix operations can be used for educational purposes or customized models. How can I visualize the training process of a neural network using back propagation in MATLAB? You can visualize training by plotting the error or loss over epochs using MATLAB's plotting functions like 'plot'. Additionally, monitoring weight updates, output responses, or decision boundaries can help understand the network's learning progress during back propagation training. What are common challenges faced when implementing back propagation in MATLAB? Common challenges include vanishing or exploding gradients, slow convergence, choosing appropriate learning rates, and ensuring proper weight initialization. Debugging back propagation code and managing numerical stability are also typical issues faced during implementation. How do I modify back propagation code for multi-layer neural networks in MATLAB? For multi-layer networks, extend the back propagation algorithm to include multiple hidden layers, calculating errors and gradients for each layer in reverse order. Implement recursive or iterative procedures to propagate errors backward through each layer, updating weights accordingly. Is it possible to implement back propagation in MATLAB without using toolbox functions? Yes, back propagation can be implemented from scratch in MATLAB by coding the forward pass, error calculation, backward error propagation, gradient computation, and weight updates manually. This approach offers deeper understanding but requires careful coding and debugging. What are some best practices for optimizing back propagation training in MATLAB? Best practices include normalizing input data, choosing appropriate learning rates, initializing weights properly, implementing momentum or adaptive learning rate methods, and monitoring training metrics. Using vectorized code and early stopping can also improve efficiency and prevent overfitting.
