Step-by-Step Breakdown of a Typical Solution

Let's examine how Stuller's solutions approach a common problem: Determine the response of a linear time-invariant (LTI) system to a given input signal.

Example Problem: Find the output $y(t)$ of an LTI system with impulse response $h(t) = e^{-2t}u(t)$ to the input $x(t) = \cos(4t)u(t)$.

Step 1: Understand the Problem

- Recognize the system is LTI.
- Input: $x(t)$.
- Impulse response: $h(t)$.

The goal is to find the output $y(t)$.

Step 2: Recall the Convolution Integral

For LTI systems,

$$y(t) = (x * h)(t) = \int_{-\infty}^{\infty} x(\tau) h(t - \tau) d\tau$$

Step 3: Use Fourier Transform or Frequency Response

Given the sinusoidal input, it's often easier to work in the frequency domain:

- Determine the system's frequency response $H(\omega)$.

- Find the Fourier Transform of $x(t)$: $X(\omega)$.
- Calculate $Y(\omega) = H(\omega) X(\omega)$.
- Inverse Fourier Transform to find $y(t)$.

Step 4: Find $H(\omega)$

- The Fourier Transform of $h(t) = e^{-2t} u(t)$:

$$H(\omega) = \int_{-\infty}^{\infty} e^{-2t} e^{-j\omega t} dt = \frac{1}{2 + j\omega}$$

Step 5: Find $X(\omega)$

- Fourier Transform of $x(t) = \cos(4t) u(t)$:

$$X(\omega) = \pi [\delta(\omega - 4) + \delta(\omega + 4)]$$

(Note: Since $x(t)$ is multiplied by $u(t)$, its Fourier Transform is a pair of delta functions at ± 4 .)

Step 6: Compute $Y(\omega)$

- Multiply $H(\omega)$ with $X(\omega)$:

$$Y(\omega) = H(\omega) X(\omega) = \pi [\delta(\omega - 4) H(\omega) + \delta(\omega + 4) H(\omega)]$$

- Evaluate at $\omega = \pm 4$:

$$H(4) = \frac{1}{2 + j4}$$

$$H(-4) = \frac{1}{2 - j4}$$

Step 7: Find $y(t)$ via Inverse Fourier Transform

- The output is:

$$y(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} Y(\omega) e^{j\omega t} d\omega$$

- Substituting $Y(\omega)$:

$$y(t) = \frac{1}{2} \left[H(4) e^{j4t} + H(-4) e^{-j4t} \right]$$

- Simplify:

$$y(t) = \frac{1}{2} \left[\frac{e^{j4t}}{2 + j4} + \frac{e^{-j4t}}{2 - j4} \right]$$

- Rationalize denominators and express as real functions:

$$y(t) = \text{Re} \left\{ \frac{e^{j4t}}{2 + j4} \right\} \times 2$$

- Calculating the magnitude and phase to write in sinusoidal form.

Step 8: Final Expression and Interpretation

The resulting $y(t)$ will be a sinusoid at frequency 4 rad/sec, scaled and phase-shifted according to the system's transfer function.
