Sample Problems and Solutions from GERE 8th Edition

Example 1: Axial Load on a Steel Bar

Problem: A steel rod of length 3 meters and cross-sectional area 50 mm² is subjected to an axial load of 20 kN. Determine the stress, strain, and elongation assuming $E = 200$ GPa.

Solution:

- Convert units: $A = 50 \text{ mm}^2 = 50 \times 10^{-6} \text{ m}^2$.
- Calculate stress: $\sigma = P/A = 20,000 \text{ N} / 50 \times 10^{-6} \text{ m}^2 = 400 \text{ MPa}$.
- Calculate strain: $\epsilon = \sigma / E = 400 \times 10^6 \text{ Pa} / 200 \times 10^9 \text{ Pa} = 0.002$.
- Calculate elongation: $\delta L = \epsilon L = 0.002 \times 3 \text{ m} = 6 \text{ mm}$.

Conclusion: The steel rod experiences a stress of 400 MPa, elongates by 6 mm, and strains by 0.2%.

Example 2: Bending Stress in a Simply Supported Beam

Problem: A simply supported beam 4 meters long carries a central load of 10 kN. The cross-section has a moment of inertia $I = 8 \times 10^{-8} \text{ m}^4$. Find the maximum bending stress.

Solution:

- Bending moment at center: $M = (P L) / 4 = (10,000 \text{ N } 4 \text{ m}) / 4 = 10,000 \text{ Nm}$.
- Distance from neutral axis to outer fiber: $y = h/2$ (assuming h known, for example $h = 0.2 \text{ m}$).
- Calculate $\sigma = (My)/I$.
- Substituting values: $\sigma = (10,000 \text{ Nm } 0.1 \text{ m}) / 8 \times 10^{-8} \text{ m}^4 = 125 \text{ MPa}$.

Conclusion: The maximum bending stress at the outer fiber is 125 MPa.

$$\text{Molarity} = \frac{\text{Moles}}{\text{Volume (L)}} = \frac{0.0316}{0.250} = 0.126, \text{M}$$

Convert volume to liters:

\[

$$V = 250\, \text{mL} = 0.25\, \text{L}$$

Problem 1: Calculating Molarity from Mass and Volume

Problem:

What is the molarity of a solution prepared by dissolving 5 grams of sodium chloride (NaCl) in 250 mL of water?

Solution:

Step 1: Calculate moles of NaCl.

- Molar mass of NaCl = 58.44 g/mol
- Moles = mass / molar mass = 5 g / 58.44 g/mol = 0.0856 mol

Step 2: Convert volume from mL to liters.

- 250 mL = 0.250 L

Step 3: Calculate molarity.

Problem 2: Finding Mass of Solute from Molarity and Volume

Problem:

How much sodium hydroxide (NaOH) (in grams) is needed to prepare 1 liter of a 0.5 M solution?

Solution:

Step 1: Find moles needed.

- Moles = molarity $\times$ volume = $0.5 \text{ mol/L} \times 1 \text{ L} = 0.5 \text{ mol}$

Step 2: Convert moles to grams.

- Molar mass of NaOH = 40.00 g/mol

- Mass = moles $\times$ molar mass = $0.5 \text{ mol} \times 40.00 \text{ g/mol} = 20 \text{ g}$

Answer:

Problem 3: Dilution Calculation

Problem:

How much of a 3 M stock solution is required to prepare 500 mL of a 0.1 M solution?

Solution:

Step 1: Use the dilution equation:

$$C_1 V_1 = C_2 V_2$$

Where:

- C_1 = initial concentration = 3 M

- V_1 = volume of stock solution needed (unknown)

- C_2 = final concentration = 0.1 M

- V_2 = final volume = 0.5 L (500 mL)

Step 2: Solve for V_1 :

$$V_1 = (C_2 \times V_2) / C_1 = (0.1 \text{ M} \times 0.5 \text{ L}) / 3 \text{ M} = 0.0167 \text{ L}$$

Step 3: Convert to mL:

$$0.0167 \text{ L} \times 1000 \text{ mL/L} = 16.7 \text{ mL}$$

Answer:

Approximately 16.7 mL of the 3 M stock solution is needed, topped up with solvent to a total volume of 500 mL.

$$= 2 \text{ mol} \times 58.44 \text{ g/mol} = 116.88 \text{ g}$$

Step 3: Percent w/v = (grams solute / 100 mL solution) $\times$ 100

- Since 1 L = 1000 mL,

$$\text{Percent w/v} = (116.88 \text{ g} / 1000 \text{ mL}) \times 100 = 11.688\%$$

Answer:

A 2 M NaCl solution is approximately 11.69% w/v.

Step 1: Write the neutralization reaction:

Step 2: Moles of NaOH:

$$= 0.1 \text{ mol/L} \times 0.025 \text{ L} = 0.0025 \text{ mol}$$

Step 3: Moles of HCl required = moles of NaOH (1:1 ratio): 0.0025 mol

Step 4: Volume of HCl solution needed:

$$V = \text{moles} / \text{concentration} = 0.0025 \text{ mol} / 0.1 \text{ mol/L} = 0.025 \text{ L}$$

Step 5: Convert to mL:

$$0.025 \text{ L} \times 1000 = 25 \text{ mL}$$

Answer:

25 mL of 0.1 M HCl is needed to neutralize 25 mL of 0.1 M NaOH.

QuestionAnswer What is the purpose of solving chemistry solution concentration practice problems? They help students understand how to calculate the concentration of solutions, such as molarity, molality, or percent composition, and improve their problem-solving skills in chemistry. How do I calculate molarity given the amount of solute and solvent volume? Molarity (M) is calculated by dividing the number of moles of solute by the volume of solution in liters: $M = \text{moles of solute} / \text{liters of solution}$. What is the key step in converting grams of solute to moles for concentration calculations? The key step is to use the molar mass of the solute to convert grams to moles: $\text{moles} = \text{grams} / \text{molar mass}$. How do I determine the percent concentration of a solution? Percent concentration is calculated as $(\text{mass of solute} / \text{total mass of solution}) \times 100\%$, or for volume-based solutions, $(\text{volume of solute} / \text{total volume}) \times 100\%$. What are common mistakes to avoid when solving solution concentration problems? Common mistakes include using incorrect units, forgetting to convert grams to moles, mixing up volume units, or misapplying the formula. Always double-check units and calculations. How can I practice to improve my skills in solving solution concentration problems? Practice with a variety of problems, review step-by-step solutions, understand the underlying concepts, and use online quizzes or flashcards to reinforce learning. What is the significance of the answer key in chemistry practice problems? The answer key helps verify your solutions, understand correct methods, and identify areas where you need further practice or clarification. Are there any online resources for free chemistry solution concentration practice problems with answer keys? Yes, websites like Khan Academy, ChemCollective, and educational platforms offer free practice problems along with detailed solutions and answer keys to aid learning.
