Introduction to the Theory of Vibrations

What Are Vibrations?

Vibrations are periodic motions of particles or systems about an equilibrium position. These oscillations can be:

- **Free vibrations:** Occur when a system is displaced and then allowed to oscillate without external force.
- **Forced vibrations:** Result from an external periodic force acting on the system.
- **Damped vibrations:** Experience energy loss over time due to internal or external damping forces.

Importance of Studying Vibrations

Understanding vibrations helps in:

- Designing safer structures and machinery
- Preventing mechanical failures caused by resonance
- Optimizing performance and lifespan of mechanical systems
- Reducing noise and vibrations in various applications

Fundamental Concepts in Vibrations Theory

Single Degree of Freedom (SDOF) Systems

This is the simplest model, where a system's motion can be described by a single coordinate. The key parameters include:

- Mass (m)
- Stiffness (k)
- Damping coefficient (c)

Equation of Motion

For an SDOF system, the differential equation governing free vibrations is:

$$m \frac{d^2x}{dt^2} + c \frac{dx}{dt} + kx = 0$$

where:

- $x(t)$: Displacement as a function of time
- m : Mass of the system
- c : Damping coefficient
- k : Stiffness of the system

Types of Vibrations

Based on damping, vibrations are classified as:

- **Undamped:** $c = 0$
- **Underdamped:** $0 < c < 2\sqrt{km}$
- **Critically damped:** $c = 2\sqrt{km}$
- **Overdamped:** $c > 2\sqrt{km}$

Solutions to the Vibrations Equations

Free Undamped Vibrations

The solution is harmonic:

$$x(t) = A \cos(\omega_n t + \phi)$$

where:

- A: Amplitude
- ω_n : Natural frequency = $\sqrt{k/m}$
- ϕ : Phase angle

Free Damped Vibrations

The solution involves exponential decay:

$$x(t) = e^{-(\zeta \omega_n t)} (A \cos(\omega_d t) + B \sin(\omega_d t))$$

where:

- ζ : Damping ratio = $c / (2 \sqrt{km})$
- ω_d : Damped natural frequency = $\omega_n \sqrt{1 - \zeta^2}$

Forced Vibrations

When an external periodic force $F(t) = F_0 \cos(\omega t)$ acts on the system, the steady-state response can be derived using impedance or phasor methods, leading to the concept of resonance when ω approaches ω_n .
