Core Concepts in Psychopharmacology According to Meyer Quenzers

Pharmacokinetics and Pharmacodynamics

Understanding how drugs are absorbed, distributed, metabolized, and excreted (pharmacokinetics) alongside their mechanisms of action (pharmacodynamics) is fundamental in psychopharmacology.

- **Absorption:** The route of administration influences onset and bioavailability.
- **Distribution:** Blood-brain barrier considerations are crucial in CNS drug delivery.
- **Metabolism:** Liver enzymes, particularly the cytochrome P450 system, determine drug interactions and individual variability.
- **Excretion:** Renal clearance affects drug duration and dosing adjustments.

In terms of pharmacodynamics, drug effects are mediated through interactions with specific neurotransmitter systems, receptor subtypes, and signaling pathways.

Neurotransmitter Systems in Psychopharmacology

The book emphasizes the importance of key neurotransmitter systems involved in psychiatric conditions:

- **Serotonin (5-HT):** Implicated in mood, anxiety, and obsessive-compulsive disorders.
- **Norepinephrine (NE):** Involved in arousal, alertness, and stress response.
- **Dopamine (DA):** Central to reward pathways, motivation, and psychosis.
- **GABA:** The primary inhibitory neurotransmitter, crucial in anxiety and seizure disorders.
- **Glutamate:** The main excitatory neurotransmitter, linked to cognition and neurotoxicity.

Understanding the interplay among these systems underpins the rationale for various pharmacological interventions.
