Common Answer Key Points:

- Melting point occurs at specific temperature where solid and liquid coexist.
- Heat of fusion: energy required to convert solid to liquid.
- Vapor pressure increases with temperature, affecting boiling points.

Gas Laws and Their Applications

The answer key provides solutions to problems involving:

- Boyle's Law ($P_1V_1 = P_2V_2$): When pressure increases, volume decreases proportionally, assuming constant temperature.
- Charles's Law ($V_1/T_1 = V_2/T_2$): Volume of a gas increases with temperature at constant pressure.
- Gay-Lussac's Law ($P_1/T_1 = P_2/T_2$): Pressure of a gas is directly proportional to temperature when volume is constant.

Sample Answer Key Explanation:

If a gas at 300 K and 1 atm has a volume of 2L, what is its volume at 600 K assuming constant pressure?

Answer: Applying Charles's Law, $V_2 = V_1 T_2 / T_1 = 2L \cdot 600K / 300K = 4L$.

Sample Practice Questions and Detailed Solutions

Providing sample questions with step-by-step solutions helps illuminate the reasoning process involved in tackling Chapter 6 problems.

Question 1: Calculating Speed and Velocity

An athlete runs 100 meters in 12 seconds. What is her average speed? If she runs 60 meters east in that time, what is her average velocity?

Solution:

- Average speed:

$$\text{Speed} = \frac{\text{Distance}}{\text{Time}} = \frac{100\text{ m}}{12\text{ s}} \approx 8.33\text{ m/s}$$

- Average velocity:

Since displacement is 60 meters east,

$$\text{Velocity} = \frac{\text{Displacement}}{\text{Time}} = \frac{60\text{ m, east}}{12\text{ s}} = 5\text{ m/s, east}$$

Key Takeaway:

Speed considers total distance traveled, while velocity considers displacement in a specific direction.

Question 2: Newton's Second Law Application

A box of mass 10 kg is subjected to a net force of 50 N. What is its acceleration?

Solution:

Using $(F = ma)$,

$$[a = \frac{F}{m} = \frac{50\text{ N}}{10\text{ kg}} = 5\text{ m/s}^2]$$

Understanding:

This straightforward calculation underscores how force and mass influence acceleration.

Question 3: Work and Power Calculation

If a person lifts a 20 kg box to a height of 2 meters in 4 seconds, what is the work done and the power exerted?

Solution:

- Work done:

$$(W = mgh)$$

$$(W = 20\text{ kg} \times 9.8\text{ m/s}^2 \times 2\text{ m} = 392\text{ J})$$

- Power:

$$(P = \frac{W}{t} = \frac{392\text{ J}}{4\text{ s}} = 98\text{ W})$$

Insight:

This illustrates how lifting work translates into energy and power.

$$\Delta U = Q - W$$

where:

- ΔU is the change in internal energy of the system,
- Q is the heat added to the system,
- W is the work done by the system.

This law emphasizes the conservation of energy during thermal processes.

Question 2: Describe the difference between transverse and longitudinal waves.

- **Longitudinal Waves:** The particle displacement is parallel to the direction of wave propagation. Sound waves in air are a common example.

Question 3: How is electrical resistance affected by temperature?

Answer:

- For most conductors, resistance increases as temperature increases due to increased atomic vibrations that impede electron flow.
- In some materials like superconductors, resistance drops to zero below a critical temperature.

Question 4: What is the significance of the wave frequency?

Answer: The frequency of a wave determines its energy and color (in the case of light). It is inversely related to wavelength as per the wave equation:

$$c = \lambda f$$

where c is the wave speed, λ is wavelength, and f is frequency.
