Understanding Flying Boats and Amphibious Aircraft

What Are Flying Boats?

Flying boats are a type of seaplane with a hull designed to land on water. Unlike floatplanes, which have separate floats attached to their fuselage, flying boats integrate the hull into the aircraft's structure, enabling them to operate directly from water surfaces.

What Are Amphibious Aircraft?

Amphibious aircraft are versatile aircraft capable of taking off, landing, and taxiing on both water and land. They feature retractable wheels or amphibious landing gear, allowing seamless transition between different terrains.
