Fundamentals of Antennas

What is an Antenna?

An antenna is a metallic structure designed to radiate or receive electromagnetic waves efficiently. It acts as a transducer, converting electrical signals into electromagnetic radiation for transmission, and vice versa for reception.

Types of Antennas

Antennas come in various forms, tailored for specific applications:

- Dipole Antennas: Simple and widely used, consisting of two conductive elements. Ideal for broad applications.
- Monopole Antennas: Similar to dipoles but with a ground plane, common in mobile devices.
- Loop Antennas: Consist of a loop of wire, often used for direction finding.
- Patch (Microstrip) Antennas: Flat and compact, suitable for mobile and satellite systems.
- Yagi-Uda Antennas: Directional antennas with multiple elements, used in TV reception.
- Horn Antennas: Used for high-frequency applications like radar and satellite communication.

Key Parameters of Antennas

Understanding an antenna's performance involves analyzing several parameters:

- Gain: Measure of how well the antenna directs energy in a particular direction (dBi).
