Common Questions and Sample Answers for Chemistry Third Quarter QSBA

Here are some typical questions you might encounter and sample answers to guide your study:

Question 1: Describe the structure of an atom and the role of each subatomic particle.

Sample Answer:

An atom consists of a nucleus containing protons and neutrons, surrounded by electrons orbiting in energy levels. Protons are positively charged and determine the atomic number; neutrons are neutral and contribute to atomic mass; electrons are negatively charged and involved in chemical bonding. The arrangement of electrons influences an atom's reactivity and bonding behavior.

Question 2: Explain the difference between ionic and covalent bonds.

Sample Answer:

Ionic bonds form when electrons are transferred from one atom to another, resulting in positively and negatively charged ions that attract each other. This type of bonding typically occurs between metals and nonmetals. Covalent bonds involve the sharing of electron pairs between atoms, usually between nonmetals, leading to molecule formation. Ionic bonds tend to produce high melting points, while covalent compounds often have lower melting points.

Question 3: Write a balanced chemical equation for the reaction between hydrogen and oxygen to produce water.

Sample Answer:

This equation is balanced with two molecules of hydrogen reacting with one molecule of oxygen to produce two molecules of water.

Question 4: State Boyle's Law and its significance in understanding gas behavior.

Sample Answer:

Boyle's Law states that at constant temperature, the volume of a gas is inversely proportional to its pressure. Mathematically, $P_1V_1 = P_2V_2$. This law explains how gases compress or expand under changing pressure conditions, which is essential in applications like breathing, syringes, and scuba diving.
