Introduction to Hershey Park Physics Packet

Hershey Park, located in Hershey, Pennsylvania, is not just a place for fun and entertainment but also an excellent case study for physics principles. The park's rides—roller coasters, drop towers, spinning rides, and more—are designed with complex physics considerations to ensure safety and excitement. The Hershey Park Physics Packet typically includes problems, diagrams, and questions that challenge students to analyze the rides' motion, forces, energy transformations, and safety features.

This guide aims to walk you through the core concepts covered in such a packet, offering explanations, examples, and practical insights into how physics is integral to amusement park ride design and operation.

Understanding the Core Physics Concepts in Hershey Park

- Motion and Kinematics

Kinematics involves describing how objects move—covering concepts like velocity, acceleration, displacement, and time. In rides like roller coasters, understanding motion is crucial for predicting ride behavior.

- Key Concepts:

- Velocity: How fast and in what direction a ride moves.
- Acceleration: Changes in velocity, especially during starts, stops, and turns.
- Displacement: The change in position from start to finish.

Example in Hershey Park:

Calculating the velocity of a roller coaster at the bottom of a drop involves knowing the height of the initial hill and applying energy conservation principles to determine speed.

- Forces and Newton's Laws

The physics packet emphasizes how forces act on riders and the ride components, governed by Newton's Laws of Motion.

- Friction and Normal Force: Friction opposes motion; normal force acts perpendicular to surfaces.

- Centripetal Force: Necessary for circular motion, such as on a loop or turn.

- G-Forces: The forces experienced by riders due to acceleration, crucial for ride design to ensure comfort and safety.

Example in Hershey Park:

Calculating the G-forces felt during a loop involves analyzing the net inward force and rider acceleration, ensuring they stay within safe limits.

- Energy Transformations

Amusement rides rely heavily on potential and kinetic energy transformations.

- Potential Energy (PE): Stored energy due to position, such as at the top of a hill.

- Kinetic Energy (KE): Energy of motion, increasing as the ride descends.

- Energy Conservation: Ideally, total mechanical energy remains constant (neglecting friction), allowing predictions of speed and position.

Example in Hershey Park:

Determining the speed of a coaster at various points by considering initial height and energy conservation.

- Work and Power

Understanding how work is done on the rides and how power is involved helps explain ride

operation and energy consumption.

- Work: Force applied over a distance.
- Power: Rate at which work is done, important in motor-driven rides.

Example in Hershey Park:

Calculating the work done by the lift hill motor to raise the coaster to the highest point.

Practical Applications of Physics in Hershey Park Rides

- Designing Safe and Thrilling Rides

Physics principles guide engineers to design rides that are both exciting and safe.

- Ensuring G-forces stay within human tolerances.
- Calculating maximum speeds to prevent derailments.
- Designing loops and turns with appropriate radius and banking angles.

- Safety Features and Restraints

Restraint systems are engineered considering forces experienced during the ride, ensuring they can withstand maximum expected forces without causing injury.

- Use of friction, padding, and secure harnesses.
- Calculations of forces during sudden stops or turns.

- Ride Efficiency and Energy Use

Optimizing the energy use of rides involves calculating the necessary motor power and minimizing energy losses due to friction.

Sample Problems and Analyses from the Hershey Park Physics Packet

Problem 1: Calculating the Speed at the Bottom of a Drop

Scenario: A roller coaster begins at a height of 50 meters. Assuming negligible friction, what is its speed at the bottom of the drop?

Solution Steps:

- Use conservation of energy:

$$PE_{\text{initial}} = KE_{\text{final}}$$

- Potential energy at top:

$$PE = m g h$$

- Kinetic energy at bottom:

$$KE = (1/2) m v^2$$

- Set $PE_{\text{initial}} = KE_{\text{final}}$:

$$m g h = (1/2) m v^2$$

- Simplify:

$$g h = (1/2) v^2$$

- Solve for v:

$$v = \sqrt{2 g h}$$

- Plug in values:

$$v = \sqrt{2 \cdot 9.8 \text{ m/s}^2 \cdot 50 \text{ m}} = \sqrt{980} \approx 31.3 \text{ m/s}$$

Conclusion: The coaster's speed at the bottom is approximately 31.3 meters per second.

Problem 2: Determining G-Forces on a Loop

Scenario: A coaster enters a vertical loop with a radius of 10 meters at a speed of 20 m/s. What is the G-force experienced at the bottom of the loop?

Solution:

- Centripetal acceleration:

$$a = v^2 / r = (20)^2 / 10 = 400 / 10 = 40 \text{ m/s}^2$$

- Total force exerted on the rider:

$$F_{\text{total}} = m (a + g)$$

- G-force:

$$G = F_{\text{total}} / (m g) = (a + g) / g = (40 + 9.8) / 9.8 \approx 49.98 / 9.8 \approx 5.1 \text{ G}$$

Conclusion: Riders experience about 5.1 times the force of gravity at the bottom of the loop, which is within safety limits but intense.
