Mechanisms of Bacterial Adhesion and Invasion

Adhesion Factors and Surface Structures

One of the initial steps in bacterial infection involves adherence to host tissues. Salyers and Whitt identified key bacterial surface molecules—fimbriae, pili, and adhesins—that facilitate attachment to host cell receptors.

- Fimbriae and Pili: Hair-like appendages that recognize specific host cell receptors, increasing bacterial colonization efficiency.
- Adhesins: Surface proteins like MSCRAMMs (microbial surface components recognizing adhesive matrix molecules) that bind to extracellular matrix components such as fibronectin, collagen, and laminin.

Functional Significance:

These structures enable bacteria to resist clearance by physical forces and immune factors, establishing a foothold for subsequent invasion.

Invasion Strategies

Beyond adhesion, bacteria employ various mechanisms to invade host cells.

- Active Invasion: Some bacteria, such as *Salmonella* and *Shigella*, induce their own uptake via manipulation of host cell cytoskeletons. This involves secretion of effector proteins through specialized secretion systems, leading to membrane ruffling and engulfment.
- Passive Invasion: Bacteria that exploit breaches in epithelial barriers, such as wounds or compromised mucosa, rely less on active invasion mechanisms.

Molecular Effectors:

Salyers and Whitt highlighted the role of bacterial secretion systems in delivering effector proteins that modulate host cell signaling, cytoskeletal rearrangements, and membrane dynamics to facilitate invasion.

Virulence Factors and Toxins

Bacterial Toxins and Their Modes of Action

Toxins are quintessential virulence factors that disrupt normal host cell functions, leading to tissue damage and disease symptoms.

Key Toxin Types:

- Exotoxins: Secreted proteins that have specific effects on host cells. Examples include diphtheria toxin, cholera toxin, and tetanus toxin.
