Understanding Systems

What Are Systems?

A system is a process or device that takes one or more signals as input, processes them according to specific rules, and produces an output signal. The analysis of systems helps understand how signals are transformed and manipulated in various applications.

Classification of Systems

- **Linear vs. Nonlinear Systems:**

- Linear systems obey the principles of superposition and homogeneity.
- Nonlinear systems do not follow these principles, often leading to more complex behavior.

- **Time-Invariant vs. Time-Varying Systems:**

- Time-invariant systems have properties that do not change over time.
- Time-varying systems have properties that change with time.

- Causal systems depend only on present and past inputs.
- Noncausal systems depend on future inputs as well.

- **Stable vs. Unstable Systems:**

- Stable systems produce bounded outputs for bounded inputs.
- Unstable systems may produce unbounded outputs even for bounded inputs.

System Representation

Systems can be mathematically modeled using various representations, such as:

- **Differential Equations:** For continuous-time systems.
