Question What are the main types of waves in physical science? The main types of waves are mechanical waves (which require a medium to travel through, like sound and water waves) and electromagnetic waves (which do not require a medium and include light, radio waves, and X-rays). How does wave frequency affect the energy of a wave? Higher frequency waves carry more energy, meaning that as the frequency increases, the energy transferred by the wave also increases. What is the difference between transverse and longitudinal waves? Transverse waves have particles vibrating perpendicular to the direction of wave travel (e.g., light waves), while longitudinal waves have particles vibrating parallel to the wave's direction (e.g., sound waves). How does the speed of a wave relate to its wavelength and frequency? Wave speed is equal to the product of its wavelength and frequency ($v = \lambda f$). If the wave speed is constant, increasing the frequency decreases the wavelength, and vice versa. What is wave reflection and how does it

occur? Wave reflection occurs when a wave bounces back after hitting a boundary or obstacle, such as light reflecting off a mirror or sound bouncing off a wall. How do waves undergo refraction and what causes it? Refraction is the bending of a wave as it passes from one medium to another with a different density, caused by a change in wave speed in the new medium. What is the principle of superposition in wave interference? The principle of superposition states that when two or more waves overlap, the resulting wave displacement is the sum of the individual displacements at each point. Why are electromagnetic waves considered transverse waves? Electromagnetic waves are considered transverse because their electric and magnetic fields oscillate perpendicular to the direction of wave propagation.
