What is the primary reason for establishing negative air pressure in an asbestos containment area?

- A) To increase airflow for worker comfort
- B) To prevent asbestos fibers from escaping the work zone
- C) To reduce the need for PPE
- D) To facilitate faster asbestos removal

Answer:

- B) To prevent asbestos fibers from escaping the work zone

Explanation:

Negative air pressure ensures that air flows into the containment area rather than out, preventing asbestos fibers from dispersing into the surrounding environment. This is a critical safety control measure during asbestos abatement.

Question 2:

Which of the following materials is considered friable asbestos?

- A) Vinyl floor tiles
- B) Pipe insulation
- C) Cement siding
- D) Hardboard paneling

Answer:

- B) Pipe insulation

Explanation:

Friable asbestos materials are easily crumbled or pulverized by hand when dry, releasing fibers into the air. Pipe insulation containing asbestos is typically friable and requires special handling.
