Introduction to Graph Theory

Graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects. Understanding the basic components, types, and properties of graphs is essential for any student beginning their journey into the field.

What is a Graph?

A graph $G = (V, E)$ consists of:

- **Vertices (or Nodes) (V) :** The fundamental units or points in the graph.
- **Edges (E) :** The connections between pairs of vertices.

Edges can be either:

- **Undirected:** Edges have no direction, representing bidirectional relationships.
- **Directed:** Edges have a direction, indicating asymmetrical relationships.

Basic Terminology and Notation

- **Order:** The number of vertices, $(|V|)$.
- **Size:** The number of edges, $(|E|)$.
- **Degree:** The number of edges incident to a vertex; in directed graphs, in-degree and out-degree

are distinguished.

- Adjacency: Two vertices are adjacent if they are connected by an edge.

Types of Graphs

Understanding different types of graphs helps in modeling various real-world problems effectively.

Undirected and Directed Graphs

- Undirected Graphs: Edges are bidirectional, suitable for mutual relationships like friendship networks.
- Directed Graphs (Digraphs): Edges have a direction, used in flow networks, web page links, etc.

Weighted and Unweighted Graphs

Connected Components

In undirected graphs, a connected component is a maximal set of vertices where each pair is connected by a path. Finding these components helps in understanding the structure and segmentation of networks.

Connectivity in Directed Graphs

- Strongly Connected: Every vertex is reachable from every other vertex.
- Weakly Connected: Connectivity exists when ignoring edge directions.

Cycles and Acyclic Graphs

Cycles are paths that start and end at the same vertex without repetition of edges or vertices (except start/end).

It is a fundamental structure used to model pairwise relationships between objects in various fields such as computer science, mathematics, and engineering. What is the difference between a directed and an undirected graph? In a directed graph, edges have a direction indicated by arrows, showing the relationship from one vertex to another. In an undirected graph, edges have no direction, representing a mutual or bidirectional relationship between vertices. What is a cycle in a graph? A cycle is a path that starts and ends at the same vertex without repeating any edges or vertices (except for the starting/ending vertex). Detecting cycles is important for understanding the structure and properties of a graph. What is a bipartite graph? A bipartite graph is a graph whose vertices can be divided into two disjoint sets such that every edge connects a vertex from one set to a vertex from the other set. These graphs are useful in modeling relationships like matching problems and network flows. What is the concept of connectivity in a graph?
