% Position of current element

dx = coil_radius cos(theta);

dy = coil_radius sin(theta);

dz = 0;

% Calculate contribution

r_vec = [x - dx; y - dy; z - dz];

r_mag = sqrt(sum(r_vec.^2, 1));

dL = [-sin(theta); cos(theta); 0] (2picoil_radius/100);

dL = repmat(dL, [1, numel(x)]);

Magnetic Field Principles and Laws

Understanding the core principles and laws helps in answering questions related to magnetic fields effectively.

Biot-Savart Law

The Biot-Savart law describes the magnetic field generated by a steady current element. It states that the magnetic field $d\mathbf{B}$ at a point due to a small current element $I d\mathbf{l}$ is proportional to the current, the length element, and the sine of the angle between $d\mathbf{l}$ and the position vector, and inversely proportional to the square of the distance.

Mathematically:

$$\mathbf{B} = \frac{\mu_0}{4\pi} \frac{I \, d\mathbf{l} \times \hat{\mathbf{r}}}{r^2}$$

where:

- μ_0 is the permeability of free space,
- $d\mathbf{l}$ is the current element vector,
- $\hat{\mathbf{r}}$ is the unit vector from the current element to the point,
- r is the distance between them.

Ampère's Law

Ampère's law relates the magnetic field around a closed loop to the electric current passing through the loop:

$$\oint \mathbf{B} \cdot d\mathbf{l} = \mu_0 I_{\text{enc}}$$

where I_{enc} is the current enclosed by the loop.

Faraday's Law of Electromagnetic Induction

This law states that a changing magnetic flux through a circuit induces an electromotive force (EMF) in the circuit:

$$\mathcal{E} = - \frac{d\Phi_B}{dt}$$

where Φ_B is the magnetic flux.

Common Questions and Answers about Magnetic Fields

1. How is a magnetic field produced?

Magnetic fields are produced by:

- Electric currents: When electric charges move, such as in a wire, they generate magnetic fields.
- Magnetic materials: Materials like iron have magnetic domains aligned in such a way that they produce a magnetic field.
- Changing electric fields: According to Maxwell's equations, a changing electric field also

produces a magnetic field.

2. What is the difference between magnetic poles?

Magnetic poles are the points where magnetic forces are concentrated:

- North Pole: The pole that points toward the Earth's geographic north when a magnet is freely suspended.
- South Pole: The opposite end of a magnet.

Unlike electric charges, magnetic poles always occur in pairs; isolating a single pole (magnetic monopole) remains hypothetical and not observed in nature.

3. How do magnetic fields interact with each other?

Magnetic fields interact based on the orientation of their poles:

- Like poles repel each other.
- Opposite poles attract each other.

The interaction results in forces that influence the position and behavior of magnetic objects.

4. How do magnetic fields affect electric currents?

Magnetic fields exert a force on moving electric charges, described by the Lorentz force:

$$\mathbf{F} = q(\mathbf{v} \times \mathbf{B})$$

where:

- q is the charge,
- $\mathbf{v}$ is the velocity of the charge,
- $\mathbf{B}$ is the magnetic field.

This force causes charges to deflect, which is fundamental in devices like electric motors and cyclotrons.

5. How is magnetic flux calculated?

Magnetic flux Φ_B through a surface is the measure of the magnetic field passing through that surface:

$$\Phi_B = \int \mathbf{B} \cdot d\mathbf{A}$$

where $d\mathbf{A}$ is the differential area vector. For uniform magnetic fields and flat surfaces:

$$\Phi_B = B A \cos \theta$$

with θ being the angle between the magnetic field and the normal to the surface.
