- Applying kinematic equations to solve problems

Common Questions and Correct Answers for the Investigation 3 Quiz

Below are typical quiz questions encountered in Moving Straight Ahead Investigation 3, accompanied by detailed answers and explanations.

Question 1: What is the definition of displacement?

Answer: Displacement is the vector quantity that refers to the change in position of an object from its initial point to its final point. It has both magnitude and direction.

Explanation: Displacement differs from distance because it considers the shortest path between two points, not the total path traveled.

Question 2: How do you interpret a velocity-time graph?

Answer: A velocity-time graph displays how an object's velocity changes over time. The slope of the graph indicates acceleration, while the area under the curve represents the displacement.

Explanation: A positive slope signifies positive acceleration, while a negative slope indicates deceleration. Horizontal lines mean constant velocity.

Question 3: If an object moves with a constant velocity, what does its position-time graph look like?

Answer: It appears as a straight line with a positive or negative slope, depending on the direction of motion.

Explanation: This linear relationship indicates uniform motion, where the object covers equal distances in equal time intervals.

Question 4: What is the significance of the area under a velocity-time graph?

Answer: The area under a velocity-time graph represents the total displacement of the object during that time interval.

Explanation: Calculating this area helps determine how far an object has moved, taking into account the velocity profile.

Question 5: How can you find the acceleration of an object from a velocity-time graph?

Answer: The acceleration is given by the slope of the velocity-time graph, calculated as change in velocity divided by change in time ($a = \Delta v / \Delta t$).

Explanation: A steeper slope indicates higher acceleration, while a flat line indicates zero acceleration.

In-Depth Breakdown of Typical Quiz Questions and Answers

Below, we explore representative questions from the Moving Straight Ahead Investigation 3 quiz, along with detailed explanations and correct answers.

Question 1: Interpreting Position-Time Graphs

Given a position vs. time graph where the line is straight and sloping upward, what does this indicate about the motion of the object?

Answer:

The object is moving with constant velocity in the forward direction.

Explanation:

A straight, sloped line on a position-time graph indicates uniform motion meaning the object covers equal distances in equal time intervals. The slope of this line represents velocity: a steeper slope equates to higher velocity.

Question 2: Calculating Velocity from Data

An object moves along a straight track. Its position at 0 seconds is 0 meters, and at 10 seconds, it is 50 meters. What is its average velocity?

Answer:

$\frac{50 \text{ m}}{10 \text{ s}} = 5 \text{ m/s}$

$\text{Average velocity} = \frac{\text{Change in position}}{\text{Change in time}} = \frac{50 \text{ m} - 0 \text{ m}}{10 \text{ s} - 0 \text{ s}} = 5 \text{ m/s}$

\]

Explanation:

Average velocity provides insight into the overall motion during the time interval. Here, the object's average velocity is 5 meters per second, indicating steady forward movement.

Question 3: Recognizing Acceleration

If a velocity-time graph shows a straight line with a positive slope, what does this tell us about the object's motion?

Answer:

The object is accelerating with a constant acceleration.

Explanation:

A linear increase in velocity over time denotes constant acceleration. The slope of the velocity-time graph directly indicates the magnitude and direction of acceleration.

Question 4: Understanding Forces and Motion

An object is moving at a constant velocity on a frictionless surface. Which of the following forces acts on the object?

- a) Unbalanced force
- b) Balanced force
- c) No force
- d) Friction force only

Answer:

- b) Balanced force

Explanation:

Constant velocity implies no net force acting on the object, according to Newton's First Law. On a

frictionless surface, if no external force is applied, the object continues moving uniformly due to inertia.

Question 5: Data Analysis and Conclusion Drawing

After analyzing the data, a student notices that the velocity of a moving object increases from 2 m/s to 8 m/s over 3 seconds. What is the acceleration?

Answer:

\[

$$a = \frac{\Delta v}{\Delta t} = \frac{8 \text{ m/s} - 2 \text{ m/s}}{3 \text{ s}} = 2 \text{ m/s}^2$$

\]

Explanation:

This positive acceleration indicates the object is speeding up at a rate of 2 meters per second squared.
