Sample MCQs with Detailed Explanations

Below are illustrative questions spanning various topics, accompanied by comprehensive explanations to enhance understanding.

- Basic Electronics MCQ

Question:

Which of the following devices acts as a voltage regulator?

- a) Zener Diode
- b) Light Emitting Diode (LED)
- c) Photodiode
- d) SCR

Answer:

- a) Zener Diode

Explanation:

A Zener diode is specifically designed to operate in the breakdown region, maintaining a nearly constant voltage across its terminals over a range of current variations. This property makes it ideal as a voltage regulator in electronic circuits. When used in reverse bias, the Zener diode clamps the voltage, providing a stable reference. LEDs emit light when forward biased, photodiodes are sensitive to light, and SCRs are used as switches but do not regulate voltage.

- Instrumentation MCQ

Question:

Which transducer converts a physical parameter directly into an electrical signal?

- a) Inductive transducer
- b) Capacitive transducer
- c) Piezoelectric transducer
- d) All of the above

Answer:

- d) All of the above

Explanation:

All these transducers directly convert physical parameters into electrical signals, but their working principles differ:

- Inductive transducers (e.g., LVDT) use changes in inductance due to physical displacement.
- Capacitive transducers vary capacitance with physical changes, such as distance or pressure.
- Piezoelectric transducers generate voltage directly when subjected to mechanical stress.

Hence, all listed options are correct.

- Circuit Theory MCQ

Question:

In a series R-L circuit, the impedance is given by:

- a) $Z = R + j\omega L$
- b) $Z = R - j\omega L$
- c) $Z = \sqrt{R^2 + (\omega L)^2}$
- d) Both a and c

Answer:

- d) Both a and c

Explanation:

Impedance (Z) in a series RL circuit is a complex quantity:

- Complex form: $Z = R + j\omega L$, where j is the imaginary unit and ω is angular frequency.
- Magnitude: $|Z| = \sqrt{R^2 + (\omega L)^2}$.

Both forms are correct descriptions: the first as a complex impedance, the second as its magnitude.

- Digital Electronics MCQ

Question:

Which logic gate outputs true only when all inputs are true?

- a) AND gate
- b) OR gate
- c) NOT gate
- d) NAND gate

Answer:

a) AND gate

Explanation:

An AND gate produces a high output only when all its inputs are high (true). If any input is low, the output is low. OR gates output high if any input is high, NOT gates invert the input, and NAND gates output low only when all inputs are high.

- Signal Processing MCQ

Question:

In an active low-pass filter, the cutoff frequency is determined by which component?

- a) Resistor and capacitor
- b) Inductor and capacitor
- c) Resistor and inductor
- d) Diode and resistor

Answer:

- a) Resistor and capacitor

Explanation:

A typical active low-pass filter uses an operational amplifier with a resistor and capacitor to set the cutoff frequency. The cutoff frequency (f_c) is given by:

$$f_c = \frac{1}{2\pi RC}$$

where (R) is the resistance and (C) is the capacitance. Inductors are not commonly used in typical active low-pass filters, and diodes are unrelated to the cutoff frequency setting.

Strategies for Approaching MCQs in Electronics and Instrumentation
