Sample Anatomy Upper Limb Past Questions and Answers

Below are example questions to illustrate the types of questions commonly encountered.

Question 1:

Describe the attachments of the deltoid muscle and its nerve supply.

Answer:

The deltoid muscle attaches proximally to the lateral third of the clavicle, acromion, and spine of the scapula. It inserts distally onto the deltoid tuberosity of the humerus. Its nerve supply is via the axillary nerve (C5-C6).

Question 2:

Name the bones that form the carpal bones and identify which bone articulates with the radius.

Answer:

The carpal bones are arranged in two rows:

- Proximal row: scaphoid, lunate, triquetrum, pisiform.
- Distal row: trapezium, trapezoid, capitate, hamate.

The scaphoid bone articulates with the radius.

Question 3:

Explain the significance of the brachial plexus in the upper limb.

Answer:

The brachial plexus is a network of nerve fibers originating from spinal nerve roots C5 to T1. It supplies motor innervation to muscles of the shoulder, arm, forearm, and hand, and provides sensory innervation to the skin of these regions. It is clinically significant because injuries to the brachial plexus can cause paralysis, weakness, or sensory loss in the upper limb.

Question 2: A patient presents with weakness in elbow flexion and supination. Which nerve is likely affected, and what is its course in the upper limb?

Answer:

- The nerve affected is the musculocutaneous nerve.
- Course:
 - It originates from the lateral cord of the brachial plexus (C5-C7).
 - It pierces the coracobrachialis muscle.
 - It runs between the biceps brachii and brachialis muscles.
 - It supplies the coracobrachialis, biceps brachii, and brachialis muscles.

Question 3: Explain the arterial supply of the upper limb and the significance of

the scapular anastomoses.

Answer:

- The arterial supply begins with the subclavian artery, which becomes the axillary artery at the lateral border of the first rib.
- The axillary artery continues as the brachial artery at the lower border of teres major.
- The brachial artery bifurcates into radial and ulnar arteries at the cubital fossa.
- Scapular anastomoses involve connections between the transverse cervical, dorsal scapular, suprascapular, subscapular, and circumflex scapular arteries.
- Significance:
 - These anastomoses provide collateral circulation around the shoulder.
 - They are vital in cases of proximal arterial occlusion, ensuring distal perfusion and preventing ischemia.

Clinical Relevance of Past Questions in Upper Limb Anatomy

Clinical scenarios are a staple in anatomy exams, emphasizing the relevance of detailed anatomical knowledge. Past questions often integrate clinical cases to assess application of anatomy:

Question What are the main bones that make up the upper limb in anatomy? The main bones of the upper limb include the humerus in the arm, the radius and ulna in the forearm, and the bones of the hand such as the carpals, metacarpals, and phalanges. Which nerves are primarily responsible for motor innervation of the upper limb muscles? The brachial plexus provides the primary motor innervation to the upper limb, with major nerves including the musculocutaneous, axillary, radial, median, and ulnar nerves. Describe the arterial supply of the upper limb. The main arterial supply comes from the subclavian artery, which continues as the axillary artery, then the brachial artery, and finally bifurcates into the radial and ulnar arteries at the level of the forearm. What are the common clinical conditions associated with the shoulder joint? Common conditions include rotator cuff tears, shoulder dislocation, impingement syndrome, and adhesive capsulitis (frozen shoulder). Explain the significance of the anatomical snuffbox. The anatomical snuffbox is a triangular depression on the lateral side of the wrist, important for palpating the scaphoid bone and assessing for fractures in the wrist. Which muscles are involved in the flexion of the elbow joint? The primary muscles involved are the biceps brachii, brachialis, and brachioradialis. Identify the boundaries of the axilla and their clinical relevance. The axilla is bounded anteriorly by the pectoralis major and minor, medially by the serratus anterior, posteriorly by the subscapularis, teres major, and latissimus dorsi, and laterally by the intertubercular sulcus of the humerus. These boundaries are important for understanding neurovascular bundle passage and surgical approaches. What is the functional importance of the rotator cuff muscles? The rotator cuff muscles (supraspinatus, infraspinatus, teres minor, subscapularis) stabilize the glenohumeral joint, facilitate shoulder movements, and prevent dislocation.
