Solve for  $x$ :  $3x + 4 = 16$

Approach:

- Subtract 4 from both sides:  $3x = 12$
- Divide both sides by 3:  $x = 4$

Tip: Always check the solution by substituting back into the original equation.

### Graphing Linear Functions

Example Question:

Plot the line  $y = 2x - 3$

Approach:

- Find the y-intercept ( $c$ ): at  $x=0$ ,  $y = -3$
- Find another point:  $x=2$ ,  $y=2(2)-3=1$
- Plot the points  $(0, -3)$  and  $(2, 1)$ , then draw the straight line through them.

Tip: Use a table of values for more complex equations.

### Word Problems Involving Linear Relationships

Example Question:

A taxi charges a base fare of £3 plus £1.50 per mile. Write an equation for the total cost  $C$  in terms of miles traveled  $m$ .

Approach:

- Total cost = base fare + (cost per mile) × miles
- $C = 3 + 1.5m$

Tip: Identify fixed costs and variable costs clearly.

## Sequence and Series Questions

Example Question:

Find the 10th term of the sequence: 5, 8, 11, 14...

Approach:

- Recognize the common difference  $d=3$
