- Expected Learning Outcome: Recognize that as the source approaches, the observed frequency increases; as it moves away, it decreases.
- Sample Question: "If the source moves towards the observer at 30 m/s and the wave speed is 340 m/s, what is the observed frequency when the emitted frequency is 1000 Hz?"

2. Observing Frequency Changes with Moving Observer

- Activity: Move the observer towards or away from a stationary source.
- Expected Learning Outcome: Understand that the observer perceives a higher frequency when moving towards the source and a lower frequency when moving away.

- Sample Question: "Calculate the observed frequency when the observer moves towards a stationary source emitting at 500 Hz at a speed of 20 m/s."

3. Both Source and Observer in Motion

- Activity: Adjust both source and observer speeds.
- Expected Learning Outcome: Comprehend how combined motions affect the perceived frequency.
- Sample Question: "Determine the observed frequency when the source moves away at 15 m/s and the observer moves towards the source at 10 m/s, with wave speed at 340 m/s and emitted frequency at 800 Hz."

4. Exploring the Effect of Wave Speed Changes

- Activity: Alter the wave speed to see its impact.
- Expected Learning Outcome: Recognize how medium properties influence wave behavior.

Using the Answer Key Effectively

An answer key is most effective when used as part of an active learning process:

- Before attempting the simulation: Review key concepts such as the Doppler formula.
- While working through activities: Use the answer key to check calculations and understanding.
- After completing exercises: Reflect on discrepancies and clarify misunderstandings.

Sample Doppler Effect Formula:

$$f' = \frac{(v \pm v_o)}{(v \mp v_s)} f$$

Where:

- f' = observed frequency
- f = emitted frequency

- v = wave speed in medium
- v_o = observer velocity (positive if moving towards source)
- v_s = source velocity (positive if moving away from observer)

Sample Questions and Corresponding Answer Key Explanations

Question 1:

A stationary observer detects a sound from a source moving towards them at 25 m/s. The wave speed is 340 m/s, and the emitted frequency is 1000 Hz. What is the observed frequency?

Answer:

Using the Doppler formula with the observer stationary ($v_o = 0$) and source moving towards the observer ($v_s = -25$) m/s:

[

$$f' = \frac{f v}{v - v_s} = \frac{1000 \times 340}{340 - (-25)} = \frac{340,000}{365} \approx 931.5, \text{ Hz}$$

]

Question 2:

A source emits sound at 600 Hz. An observer moves away from the source at 30 m/s, with wave speed at 340 m/s. What is the observed frequency?

Answer:

Since the observer moves away ($v_o = +30$) m/s and source is stationary ($v_s = 0$):

[

$$f' = \frac{f (v + v_o)}{v} = \frac{600 \times (340 + 30)}{340} = \frac{600 \times 370}{340} \approx 652.9, \text{ Hz}$$

]

Question Answer How does the Doppler Effect manifest in Phet simulations when the source of sound moves towards or away from the observer? In Phet simulations, when the sound source moves toward the observer, the wavelength shortens, resulting in a higher pitch; when it moves away, the wavelength lengthens, producing a lower pitch. The simulation visually demonstrates these changes through shifts in wave patterns and frequency. What key concepts can students learn about the Doppler Effect using Phet simulations? Students can learn how the relative motion between a source and observer affects perceived frequency and pitch, understand the relationship between wave speed, frequency, and wavelength, and observe how the Doppler Effect applies to various scenarios like sirens, radar, and astronomy. How can I interpret the answer key in Phet Doppler Effect simulations to verify my understanding? The answer key provides expected outcomes for different scenarios such as source moving towards or away from the

observer?highlighting the changes in frequency and wavelength. Comparing your observations with the key helps confirm your grasp of how motion influences sound waves. Are there interactive features in Phet simulations that help visualize the Doppler Effect more clearly? Yes, Phet simulations often include adjustable parameters like source speed, observer position, and wave speed, allowing students to manipulate variables and observe real-time changes in wave patterns, frequency, and pitch, enhancing understanding of the Doppler Effect. What common misconceptions about the Doppler Effect can be addressed using Phet simulations and the answer key? Simulations help clarify that the change in perceived frequency is due to relative motion, not an actual change in the source's emitted frequency. The answer key reinforces that wave speed remains constant in a medium, and only the perceived frequency shifts due to motion. How can teachers utilize the 'answer key' from Phet Doppler Effect simulations to support student learning? Teachers can use the answer key to provide correct explanations, guide students through troubleshooting their observations, and reinforce key concepts by comparing student results with expected outcomes, thereby deepening conceptual understanding of the Doppler Effect.
