Sample Biology Questions and Solutions for O Level UCE

Below are some typical questions you might encounter, along with detailed solutions to guide your understanding.

Question 1: Describe the structure and function of a typical plant cell.

Solution:

A typical plant cell has several key components:

- **Cell Wall:** Provides structural support and protection. Composed mainly of cellulose.
- **Cell Membrane:** Controls the movement of substances in and out of the cell.
- **Chloroplasts:** Contain chlorophyll and are sites of photosynthesis, enabling the plant to make food.
- **Nucleus:** Controls cell activities and contains genetic material.
- **Vacuole:** Stores cell sap, maintains turgor pressure, and supports the cell structure.

- **Cytoplasm:** Gel-like substance where organelles are suspended, facilitating cellular processes.

The main function of a plant cell is to carry out photosynthesis, support the plant structure, and facilitate growth and reproduction.

Question 2: Explain the process of photosynthesis and its importance.

Solution:

Photosynthesis is a process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. The general equation is:

Carbon dioxide + Water → Glucose + Oxygen

- **Light Absorption:** Chlorophyll in the chloroplasts absorbs sunlight.
- **Light-Dependent Reactions:** Occur in the thylakoid membranes; light energy splits water molecules (photolysis), releasing oxygen, electrons, and protons.
- **Light-Independent Reactions (Calvin Cycle):** Occur in the stroma; carbon dioxide is fixed into glucose using ATP and NADPH produced in the light-dependent reactions.

Photosynthesis is vital because it provides oxygen for respiration and forms the base of food chains. It also influences atmospheric carbon dioxide levels, impacting climate regulation.

Question 3: Describe the human circulatory system and its main functions.

Solution:

The human circulatory system consists of the heart, blood vessels, and blood. Its main functions include:

- **Transport of Oxygen and Nutrients:** Blood carries oxygen from the lungs to body tissues and nutrients from the digestive system.
- **Removal of Waste Products:** Blood transports carbon dioxide and other waste to excretory organs.
- **Defense Against Diseases:** Blood contains white blood cells that fight infections.
- **Regulation of Body Temperature and pH:** Blood helps maintain homeostasis.

The heart pumps oxygenated blood through arteries to tissues and deoxygenated blood back via veins to the lungs for oxygenation.

Question 4: What is osmosis, and why is it important for living organisms?

Solution:

Osmosis is the movement of water molecules from a region of low solute concentration to a region of high solute concentration across a semi-permeable membrane. It is crucial because:

- Maintains cell turgor pressure, which keeps plant cells and tissues firm.
- Facilitates nutrient absorption in the intestines.
- Regulates water balance in animal cells.
- Supports processes like kidney function and blood volume regulation.

Without proper osmosis, cells can become either shriveled or burst, leading to health issues or plant wilting.
