Common Types of Questions and Their Solutions

- Triangle Congruence Postulates and Theorems

Questions Typically Asked:

- Which postulate proves triangle congruence?
- Given two triangles with certain side and angle measurements, determine if they are congruent.

Key Postulates and Theorems:

- SSS (Side-Side-Side): All three corresponding sides are equal.
- SAS (Side-Angle-Side): Two sides and the included angle are equal.
- ASA (Angle-Side-Angle): Two angles and the included side are equal.
- AAS (Angle-Angle-Side): Two angles and a non-included side are equal.
- HL (Hypotenuse-Leg): For right triangles only, hypotenuse and one leg are equal.

Sample Problem & Solution:

Question: Given two triangles with sides 7 cm, 10 cm, 12 cm and 7 cm, 10 cm, 12 cm respectively, are the triangles congruent?

Answer: Yes, by SSS postulate, since all three sides are equal in both triangles.

- Properties and Theorems of Isosceles and Equilateral Triangles

Key Properties:

- In an isosceles triangle, angles opposite equal sides are equal.
- In an equilateral triangle, all sides and angles are equal (each angle = 60°).

Sample Question & Solution:

Question: Triangle ABC has $AB = AC$. If angle ABC measures 45° , what is the measure of angle A?

Solution: Since $AB = AC$, triangle ABC is isosceles with angles opposite equal sides. Therefore, angle A = $180^\circ - 2 \times 45^\circ = 90^\circ$.

- Triangle Inequality Theorem

Statement: The sum of the lengths of any two sides must be greater than the length of the remaining side.

Test Strategy:

- Always check the three combinations to verify the possibility of a triangle.

Sample Problem & Solution:

Question: Given sides 8 cm, 5 cm, and 14 cm, can these lengths form a triangle?

Solution: Check sums:

- $8 + 5 = 13$, which is less than 14 ? does not form a triangle.

Answer: No, these lengths cannot form a triangle.

- Similarity of Triangles

Criteria for Similarity:

- AA (Angle-Angle): Two pairs of angles are equal.
- SSS (Side-Side-Side): Corresponding sides are proportional.
- SAS (Side-Angle-Side): One side is proportional, and the included angles are equal.

Application Tips:

- Identify corresponding angles and sides.
- Use proportional reasoning for side lengths.
- Confirm the criteria before concluding similarity.

Sample Problem & Solution:

Question: Triangle PQR is similar to triangle XYZ. If $PQ = 6$ cm, $PR = 9$ cm, and $XY = 4$ cm, what is the length of XZ if the ratio of similarity is 2:3?

Solution: Since the ratio of similarity is 2:3, then corresponding sides are proportional.

- $PQ / XY = 6 / 4 = 1.5$
- The ratio 2:3 = 0.666..., but since $6/4 \neq 1.5$, the ratio is 3:2. To match the ratio, sides should be scaled accordingly.

Alternatively, find XZ:

- XZ corresponds to PR (9 cm):
- $XZ = (XY) \times (3/2) = 4 \times (3/2) = 6$ cm.

- Pythagorean Theorem and Its Applications

Statement: In a right triangle, $a^2 + b^2 = c^2$ where c is the hypotenuse.

Test Tips:

- Use the theorem to find missing side lengths.
- Apply to real-world problems like distance calculations.

Sample Problem & Solution:

Question: A ladder leaning against a wall reaches a height of 12 meters. The foot of the ladder is 5 meters from the wall. What is the length of the ladder?

Solution: Use Pythagoras:

$$c = \sqrt{12^2 + 5^2} = \sqrt{144 + 25} = \sqrt{169} = 13 \text{ meters.}$$

Answer: The ladder is 13 meters long.

- Special Segments in Triangles
