Design Tricks for a Fast Rain Gutter Regatta Trimaran

1. Streamlining the Hulls for Reduced Water Resistance

Why it matters:

Hull shape significantly influences water drag. A more streamlined hull glides smoothly through water, reducing resistance.

Design tricks:

- Use a Narrow, Sharp Bow:
 - A pointed bow cuts through water efficiently, reducing wave-making resistance.
 - Avoid blunt or rounded bows that cause unnecessary turbulence.
- Optimize Hull Cross-Section:
 - A teardrop or rounded bottom with a slight V-shape minimizes drag.
 - Keep the hulls thin and flat-bottomed if allowed, but ensure they remain buoyant.
- Smooth Surface Finish:
 - Sand and polish hull surfaces to eliminate bumps and roughness.
 - Apply a thin coat of waterproof varnish for a slick finish.
- Appropriate Hull Length:
 - Longer hulls generally glide better, but must be balanced with stability and maneuverability.
 - For RGR, a length-to-beam ratio of about 3:1 is often optimal.

2. Optimizing the Outriggers (Foil) for Stability and Speed

Why it matters:

Outriggers keep the trimaran balanced, preventing yaw and capsizing, especially at high speeds.

Design tricks:

- Reduce Cross-Sectional Area:
 - Minimize the width of outriggers to lower drag but maintain enough volume for stability.
 - Use slim, lightweight outriggers with tapered ends.
- Positioning of Outriggers:
 - Place outriggers slightly ahead of the main hull's midpoint to prevent leeway and improve directional stability.
 - Experiment with the angle of attachment; slight outward tilt can improve lateral stability.
- Material Choice:
 - Use lightweight yet stiff materials such as balsa wood, foam core, or lightweight plastics.

- Ensure outriggers are rigid to prevent flexing under load.
- Hydrodynamic Shape:
 - Incorporate a gentle V or rounded bottom shape to reduce water resistance.
 - Keep the bottom surface smooth and aligned with the main hull.

3. Fine-Tuning Sail Design and Rigging

Why it matters:

The sail is the primary source of propulsion; its shape, size, and trim directly affect speed.

Design tricks:

- Sail Shape and Size:
 - Use a slightly smaller sail for high-speed runs to prevent overpowering.
 - Opt for a triangular or slightly curved sail profile for better aerodynamics.

 - Position the sail's CE slightly aft of the boat's center of buoyancy to maintain stability.
 - Experiment with sail angle (sheeting in/out) to find the optimal trim angle.
- Mast Height:
 - A taller mast can provide more leverage for the sail but may introduce stability issues.
 - Keep the mast as tall as permissible within rules, balancing height with structural strength.

4. Weight Placement and Material Choices

Why it matters:

Proper weight distribution enhances stability without adding unnecessary mass.

Design tricks:

- Center of Gravity (CG):
 - Place weights low and slightly forward to prevent nosediving or yawing.
 - Use small, dense weights (e.g., lead or tungsten) for fine adjustments.
- Lightweight Construction Materials:
 - Use lightweight woods, foam cores, or plastics for hulls and outriggers.
 - Avoid excess material that adds weight without benefits.
- Balancing the Boat:
 - Test runs to determine if the boat tilts or veers; adjust weight accordingly.
 - Keep the overall weight within allowed limits while maximizing boat speed.

5. Selecting and Positioning the Centerboard or Keel

Why it matters:

A centerboard or keel improves directional stability and reduces sideways drift.

Design tricks:

- Minimal but Effective:
 - Use a small, streamlined keel or centerboard that can be adjusted.
 - Position it centrally and slightly aft for optimal control.
- Hydrodynamic Shape:
 - Rounded or tapered shapes reduce water resistance.
 - Keep it lightweight to prevent unnecessary drag.
