- Basic hardware setup occurs to bring the system into a known state.

2. Bootloader Execution

- The firmware's bootstrap code, commonly known as the bootloader, runs.
- Responsible for hardware configuration, memory setup, and loading the main firmware.
- Often stored in non-volatile memory like NOR/NAND flash or eMMC.

3. Kernel Loading and Initialization

- The embedded operating system kernel (e.g., Linux, RTOS) loads into RAM.
- Performs device driver initialization, hardware abstraction, and system setup.

4. User Space Initialization

- Application processes start.
- System services and user interfaces become available.

Key Takeaway: The total boot time is a cumulative result of these stages. Optimization involves reducing delays at each step without compromising system stability.
