Sample Questions and Corresponding Answer Key

Below are some typical questions from the Web Quest, along with detailed answers as found in the answer key.

Question 1: Describe the main layers of Earth's interior and their functions.

Answer:

- Crust: The Earth's outermost layer; solid and relatively thin. It forms Earth's surface and is composed of continental and oceanic crust.
- Mantle: Located beneath the crust; semi-solid rock that flows slowly, enabling tectonic plate movement through convection currents.
- Outer Core: Liquid layer composed mainly of iron and nickel; generates Earth's magnetic field.
- Inner Core: Solid sphere made primarily of iron and nickel; responsible for Earth's magnetic stability and heat distribution.

Question 2: Explain how the movement of tectonic plates can lead to earthquakes.

Answer:

Earthquakes occur when stress accumulates along faults due to tectonic plate movements. At divergent boundaries, plates move apart, creating tension. At convergent boundaries, plates collide,

causing compression. Transform boundaries involve lateral sliding. When the stress surpasses the strength of rocks, it releases energy in the form of seismic waves, resulting in an earthquake.

Question 3: What are the differences between shield volcanoes and composite volcanoes?

Answer:

- Shield Volcanoes: Broad, gently sloping volcanoes formed by low-viscosity lava that can flow long distances. Example: Mauna Loa in Hawaii.
- Composite Volcanoes (Stratovolcanoes): Steep-sided volcanoes built from alternating layers of lava and ash. They often have more explosive eruptions. Example: Mount St. Helens.
