Example: Solving a Classic Problem Using Walter Savitch's Method

Let's walk through an example: Finding the sum of all nodes in a binary tree.

Problem Statement: Given a binary tree, compute the total sum of all its nodes.

Step-by-step solution:

Understanding the Problem

- Input: Binary tree with integer values.
- Output: Sum of all node values.
- Constraints: Tree can be empty.
- Edge cases: Tree with only one node, or skewed trees.

Planning the Approach

- Use recursion to traverse nodes.
- For each node, sum its value with the sums of its left and right subtrees.

Developing the Algorithm (Pseudocode):

...

```
function sumTree(node):
```

```
    if node is null:
```

```
        return 0
```

```
    leftSum = sumTree(node.left)
```

```
    rightSum = sumTree(node.right)
```

```
    return node.value + leftSum + rightSum
```

...

Implementation:

```
```python
def sum_tree(node):
 if node is None:
 return 0
 return node.value + sum_tree(node.left) + sum_tree(node.right)
```
```

Testing:

- Empty tree: should return 0.
- Single node with value 5: should return 5.
- Tree with multiple nodes: verify the sum matches expected.

Analysis:

- Time complexity: $O(n)$, where n is the number of nodes.
- Space complexity: $O(h)$, where h is the height of the tree (due to recursion stack).
