Common Questions and the Hurricane Motion Gizmo Answer Key

Understanding the typical questions that arise from using the gizmo is essential for mastering the concepts. Here, we address some frequently asked questions and provide the corresponding answers.

1. What causes a hurricane to change direction?

Answer:

Hurricanes are primarily influenced by large-scale wind patterns such as the Trade Winds, prevailing westerlies, and the Coriolis effect. When these winds shift or interact with other atmospheric systems like high-pressure ridges or low-pressure troughs, they can steer hurricanes in different directions. The gizmo demonstrates how variations in wind flow at different altitudes can cause a storm to turn or move more rapidly.

2. Why does a hurricane sometimes intensify and other times weaken?

Answer:

Hurricanes intensify when they pass over warm ocean waters, which provide energy through heat transfer, and when atmospheric conditions are conducive (low vertical wind shear, high humidity). Conversely, they weaken over cooler waters, land (due to friction and lack of moisture), or when encountering high wind shear that disrupts the storm's structure. The gizmo allows users to modify pressure and temperature conditions to visually see these effects.

3. How does the Coriolis effect influence hurricane motion?

Answer:

The Coriolis effect, caused by Earth's rotation, deflects moving air to the right in the Northern Hemisphere and to the left in the Southern Hemisphere. This deflection causes hurricanes to spin counterclockwise in the North and clockwise in the South and influences their overall path. The gizmo illustrates this by showing how the storm's rotation and trajectory are affected by the Coriolis force.

4. What is the significance of pressure drops within a hurricane?

Answer:

A decreasing central pressure within a hurricane indicates strengthening, as lower pressure correlates with higher wind speeds and storm intensity. The gizmo displays pressure readings, helping users recognize storm development stages and predict potential landfall severity.

5. How do environmental factors like wind shear impact hurricane movement?

Answer:

Vertical wind shear, which is the change in wind speed or direction with altitude, can weaken hurricanes by tilting or disrupting their structure, preventing them from intensifying. The gizmo can simulate wind shear effects, showing how storms are affected when they encounter strong upper-level winds.
